

May 10, 2019, TMT Meeting

1. Option 1 – Balance Spill between John Day and The Dalles Dams in order to achieve spill at The Dalles Dam no lower than 40%.
 - a. Prioritizing spill at The Dalles Dam no lower than 40% would likely result in spill in the John Day tailwater less than 120% TDG.

2. Option 2 – Prioritize spill to meet but not exceed 120% TDG below both John Day and The Dalles Dams.
 - a. The Dalles Dam spill would likely be below 40%. If The Dalles Dam forebay TDG \geq 120%, to meet state water quality standards, the Corps would reduce spill incrementally, down to as low as 0% to maintain tailrace TDG to meet but not exceed 120%.
