Native, nonsalmonid GBT report (June 7-10)

All,

Below is a brief summary of GBT sampling for native nonsalmonids below Ice Harbor, McNary, and Bonneville for the week of June 7. Sampling at McNary produced four sculpin with GBT in the unpaired fins or eyes. Three fish had severe GBT in the eyes (rank 4; see attached photo) and an additional 13 sculpin had GBT on the head, body, or paired fins. Below Ice Harbor, five different species were collected, and no fish showed signs of GBT in the unpaired fins or eyes; however, one sculpin had GBT elsewhere on the body. Below Bonneville Dam, three species were collected and none exhibited signs of GBT. We also collected and examined 21 subyearling fall Chinook salmon and none had GBT. Let me know if you have any questions.
