McNary Temperature Report #2
June 18 - 24, 2010

A total of 292,738 juvenile salmonids were collected at the McNary Juvenile Fish Facility (JFF) for this weekly period. Peak collection day was June 22, with 104,344 fish (Figure 1 and Table 1). Subyearling fall chinook accounted for 96.4% of the total collection. Daily flows for this week averaged 322.9kcfs. There has been court ordered spill since April 10. Spill averaged 151.1kcfs. The system mortality averaged 0.2% and sample tank mortality averaged 1.7%. Mortalities are being enumerated from the separator, the sample tanks and raceway 9W.

Fish are being bypassed daily with a 24-hour sample taken every other day. In the month of June, the sample will be counted on the even numbered days.

Air temperatures are cool at the McNary JFF, with an average over the week of 66.4°F. Maximum hourly air temperature was 89.0°F on June 24 (Figure 2). The minimum temperature was 48.6°F on June 18 between 5:00 and 6:00 a.m. Winds over the course of the week averaged 2.2mph with gust peaking up to 22.0mph on June 21.

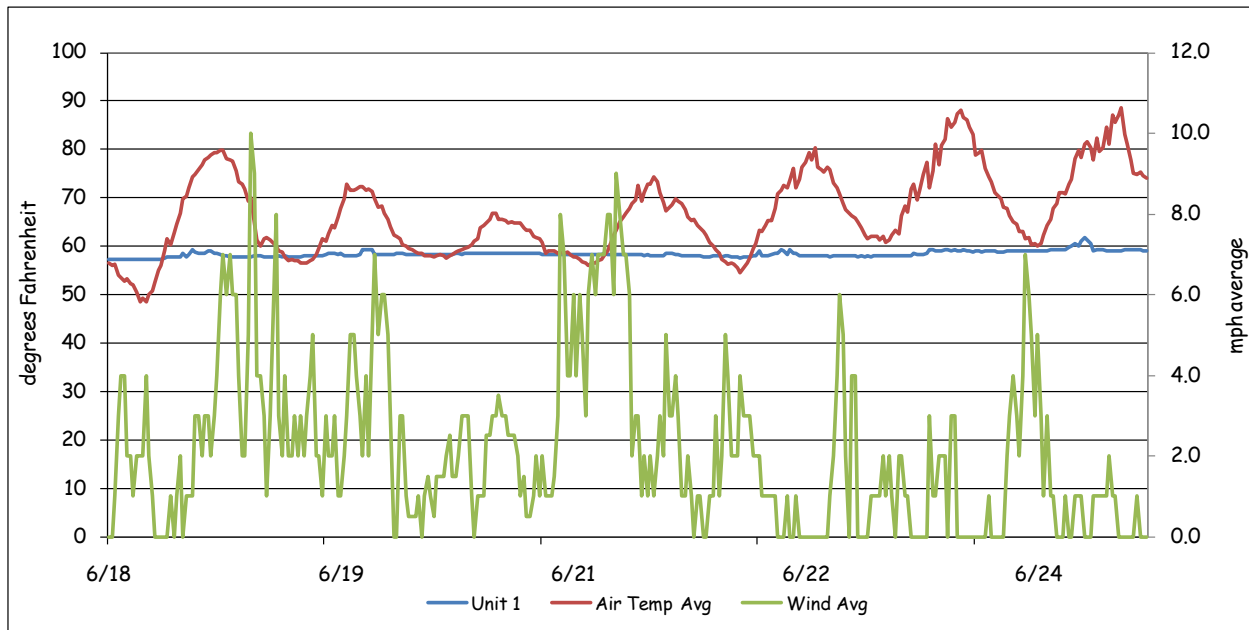

Figure 2: Weather and Forebay Water Temperature

There are 36 temperature probes located through out the Project and the JFF. These probes are set to record temperatures at 30-minute intervals. These probes are located at the following locations:

- 1) Forebay, near elevation 335 approximately 5 feet below the surface. These are attached to the pier noses in front of turbine units 1, 3, 5, 7, 8, 10, 12, and 14.
- 2) In front of spillbays 21, 17, 12, 7 and 2, approximately 5 feet below the surface. These probes are hung in the center of the spillbay, on the tailrace side.
- 3) Attached to the handrail in the center of the “B” turbine gateway slots,

approximately 2 to 3 feet below the surface, in all 14 turbine units.

- 4) Tailwater locations are at turbine unit 1 and 14 (tailrace), and the wingwall of the navigation lock. These were placed 5 feet below the water surface.
- 5) The collection channel had probes installed below turbine units 12, 8 and past unit 1 at the beginning of the transition screen.
- 6) The barge transportation dock.
- 7) Fish separator.
- 8) Transport holding raceway #1 at a depth of 2 – 3 feet.

Forebay water temperatures (Table 2) peaked this period with 70.0°F on June 24 at 7:30 p.m. in front of unit 7. The average was 59.5°F across the forebay for the week. Gatewell water temperatures for all units combined also averaged 58.6°F (Table 3). Gatewell temperatures peaked at 66.2°F on June 15 in unit 10 at 7:00 p.m.

The differences in temperatures between the gatewell at unit 1 and the gatewell at unit 14 are illustrated in Figure 3. This graph takes the temperature in the gatewell and subtracts unit 14 from that gatewell (unit 1 – 14). It then continues down the powerhouse subtracting unit 14 from each consecutive unit. A negative number indicates that unit 14 was the warmer unit. Conversely, a positive number indicates that unit 1 was warmer. This shows the reader the amount of variance from one end of the powerhouse to the other that can be seen through out a 24-hour period.

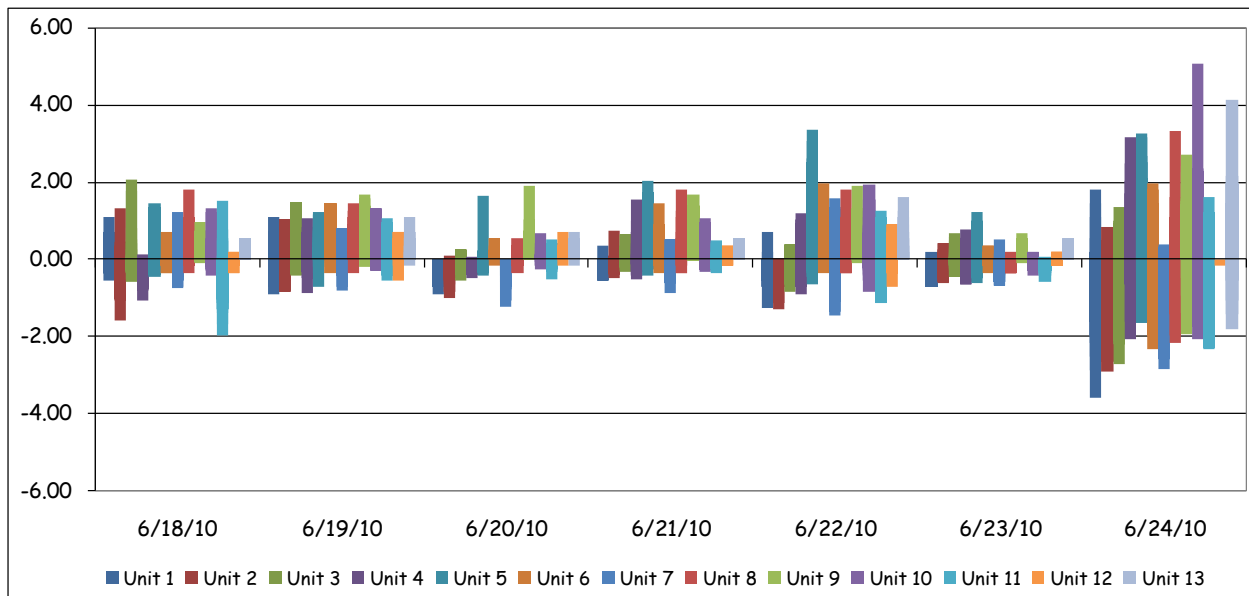

Figure 3: Gatewell Temperature Differentials for Units 1 - 14

Forebay differentials (Figure 4) are calculated by taking the forebay temperature and subtracting the corresponding gatewell temperature from it (1F – unit 1). A negative number would indicate that the gatewell was warmer. Conversely, a positive number indicates that the forebay is warmer. Again, this shows the reader the amount of variance that can be seen between the forebay and the gatewell through out a 24-hour period.

Average water temperature in the collection channel was 58.5°F (Table 4) for the week. A maximum temperature of 62.6°F was recorded June 24 at 7:00 p.m. below Unit 8. Temperatures at the separator averaged 58.5°F for the period with a maximum daily temperature of 61.5°F (Table 5). The temperature in raceway #1 averaged 58.5°F with a high of 61.5°F June 24.

Collection channel differentials (Table 6) are calculated by taking the forebay temperature and subtracting the collection channel temperature from it at the three corresponding points. This is an average of the variances between the forebay and the collection channel. A negative number indicates that the collection channel was warmer. A positive number indicates the forebay was warmer. The graph (Figure 5) shows the variance through out the week.
