**McNary Temperature Report #5**  
**July 9 - 15, 2010**

A total of 248,887 juvenile salmonids were collected at the McNary Juvenile Fish Facility (JFF) for this weekly period. Peak collection day was July 10, with 182,106 fish (Figure 1 and Table 1). Subyearling fall chinook accounted for 99.8% of the total collection. Daily flows for this week averaged 203.3kcfs. There has been court ordered spill since April 10. Spill averaged 101.8kcfs. The system mortality averaged 0.02% and sample tank mortality averaged 0.36%. Mortalities are being enumerated from the separator, the sample tanks and raceway 9W.

Fish are being bypassed daily with a 24-hour sample taken every other day until July 15. In the month of June, the sample will be enumerated on the even numbered days. There will be units that are off line for the remainder of the season. Units 2 and 7 are off for rewinding. Units 3 and 4 are off for transformer replacement. This means that the probes in 3 and 4 will be put in the “A” slot and “C” slot respectively. The orifices in unit 2 have been opened. All other orifices are open.

Air temperatures warmed up at the McNary JFF, with an average over the week of 74.1°F. Maximum hourly air temperature was 100.7°F on July 9 (Figure 2). The minimum temperature was 51.0°F on July 13 at 5:30a.m. Winds over the course of the week averaged 2.6mph with gust peaking up to 42.0mph on July 12.

**Figure 2: Weather and Forebay Water Temperature**

There are 36 temperature probes located through out the Project and the JFF. These probes are set to record temperatures at 30-minute intervals. These probes are located at the following locations:

- 1) Forebay, near elevation 335 approximately 5 feet below the surface. These are

- attached to the pier noses in front of turbine units 1, 3, 5, 7, 8, 10, 12, and 14.
- 2) In front of spillbays 21, 17, 12, 7 and 2, approximately 5 feet below the surface. These probes are hung in the center of the spillbay, on the tailrace side.
  - 3) Attached to the handrail in the center of the “B” turbine gatewell slots, approximately 2 to 3 feet below the surface, in all 14 turbine units.
  - 4) Tailwater locations are at turbine unit 1 and 14 (tailrace), and the wingwall of the navigation lock. These were placed 5 feet below the water surface.
  - 5) The collection channel had probes installed below turbine units 12, 8 and past unit 1 at the beginning of the transition screen.
  - 6) The barge transportation dock.
  - 7) Fish separator.
  - 8) Transport holding raceway #1 at a depth of 2 – 3 feet.

Forebay water temperatures (Table 2) peaked this week with 74.9°F on July 9 at 3:30p.m. in front of unit 12. The average was 66.9°F across the forebay. Gatewell water temperatures for all units combined averaged 65.9°F (Table 3). Gatewell temperatures peaked at 71.4°F on July 14 in unit 8 at 5:30p.m.

The differences in temperatures between the gatewell at unit 1 and the gatewell at unit 14 are illustrated in Figure 3. This graph takes the temperature in the gatewell and subtracts unit 14 from that gatewell (unit 1 – 14). It then continues down the powerhouse subtracting unit 14 from each consecutive unit. A negative number indicates that unit 14 was the warmer unit. Conversely, a positive number indicates that unit 1 was warmer. This shows the reader the amount of variance from one end of the powerhouse to the other that can be seen through out a 24-hour period.

**Figure 3:** Gatewell Temperature Differentials for Units 1 - 14

Forebay differentials (Figure 4) are calculated by taking the forebay temperature and subtracting the corresponding gatewell temperature from it (1F – unit 1). A negative number would indicate that the gatewell was warmer. Conversely, a positive number indicates that the forebay is warmer. Again, this shows the reader the amount of variance that can be seen between the forebay and the gatewell through out a 24-hour period.

**Figure 4:** Temperature Differentials Between Forebay and Gatewell

Average water temperature in the collection channel was 66.0°F (Table 4) for the week. A maximum temperature of 69.3°F was recorded July 9 at 9:00p.m. below Unit 8. Temperatures at the separator averaged 65.7°F for the week with a maximum daily temperature of 67.8°F (Table 5). The temperature in raceway #1 averaged 65.7°F with a high of 67.8°F July 14.

Collection channel differentials (Table 6) are calculated by taking the forebay temperature and subtracting the collection channel temperature from it at the three corresponding points. This is an average of the variances between the forebay and the collection channel. A negative number indicates that the collection channel was warmer. A positive number indicates the forebay was warmer. The graph (Figure 5) shows the variance through out the week.
