Willamette Instream Flow Project: Integrated Tools for the Evaluation of Alternative Flow Management Strategies

James T. Peterson, Jessica E. Pease, Luke Whitman, James White, Laurel Stratton Garvin, Stewart Rounds, and Rose Wallick

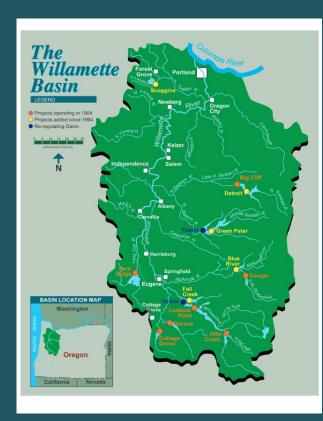

#### **Context: Willamette Water Allocation**

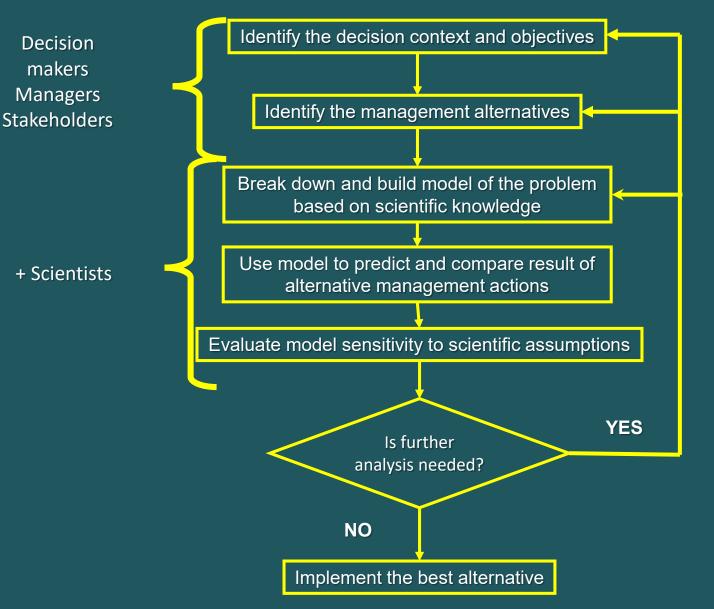

**Water allocation:** Agricultural irrigation **Municipal** Industrial use **Ecosystem needs BiOp** Flow targets **Temperature targets** 

Managers: What are the optimal flow regimes? What are the tradeoffs?

### **Structured Decision Making Process**

#### Phase I

 Identify key knowledge gaps and analyses

#### Phase 2

- Integration of hydrology and temperature models
- Tributary response
- Additional objectives

#### Science of Willamette Instream Flows Team

SWIFT - team of experts to review and develop science for instream flows

OREGO **Interdisciplinary Team:** U.S. TISH & WILDLIFT SERVICE The Nature Conservancy tecting nature. Preservin Hydrologists Geomorphologists Water quality modelers Ecologists Managers Public Stakeholders

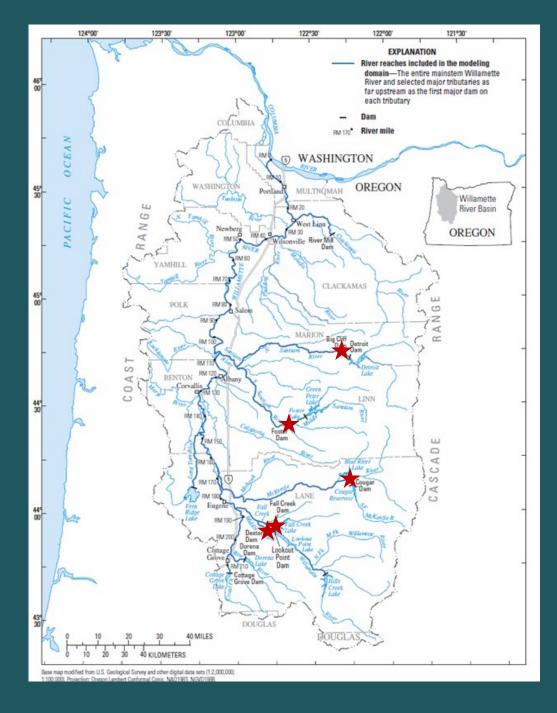

#### **Decision Context**

Location: Willamette River system above Willamette Falls

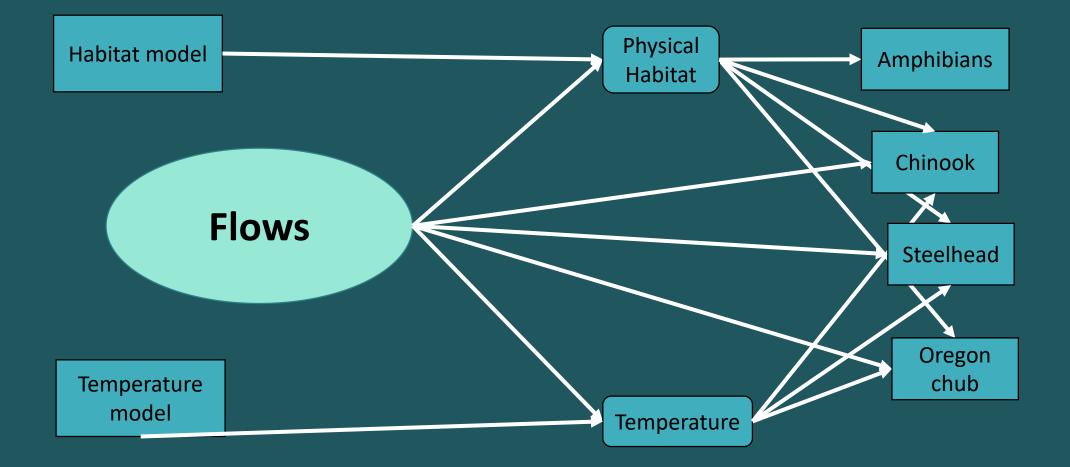

Time Period: Year round

Purpose: Identify instream flow needs for river ecosystem and dependent fish, wildlife and vegetation

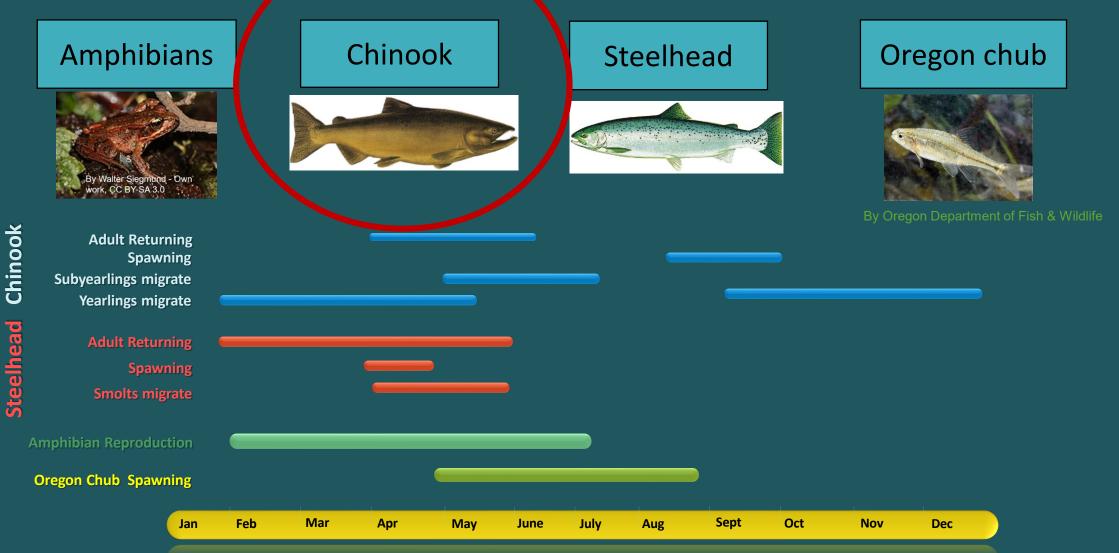

Willamette and tributaries: N. & S. Santiam, McKenzie, MF Willamette, below USACE dams

# **Decision Model Framework**

# Objectives

## A Disconnect

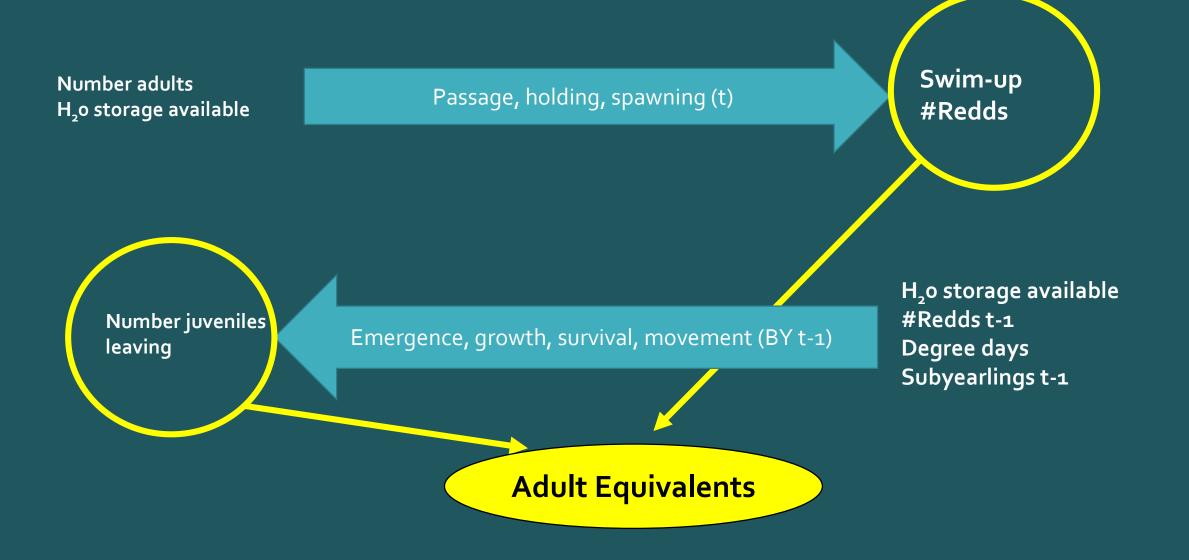

### Chinook

Adult Returning Spawning Subyearlings migrate Yearlings migrate

# Solution: 2 Sub-models

# Chinook Streamflow Models

Chinook

- Weekly time step
- Simulated 6 size classes of juveniles:

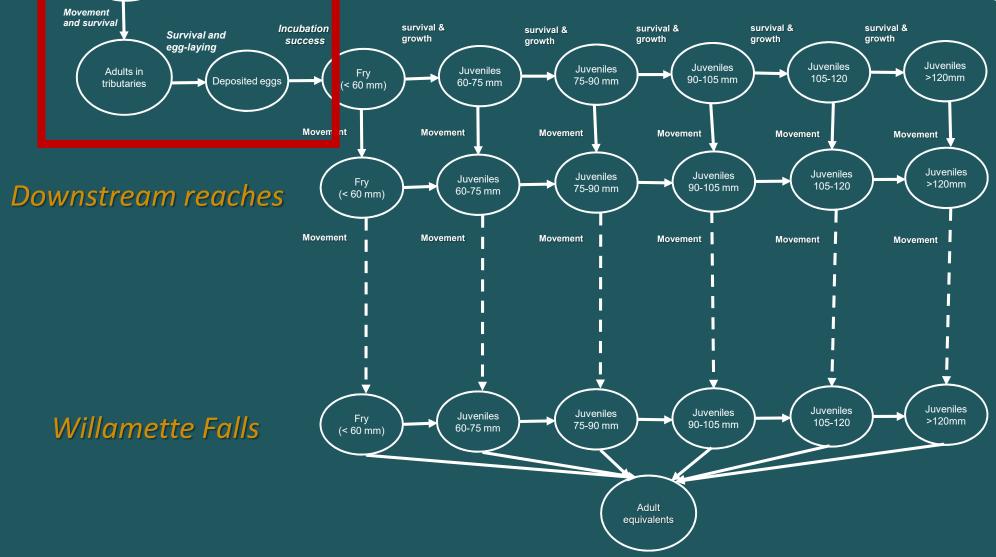

<60 mm, 60-75 mm, 75-90mm, 90-105, 105-120, >120

- Begins March 1 with adults returning
- Adult submodel user specified runsize, % hatchery
- Juvenile submodel user specified redds, subyearlings t-1

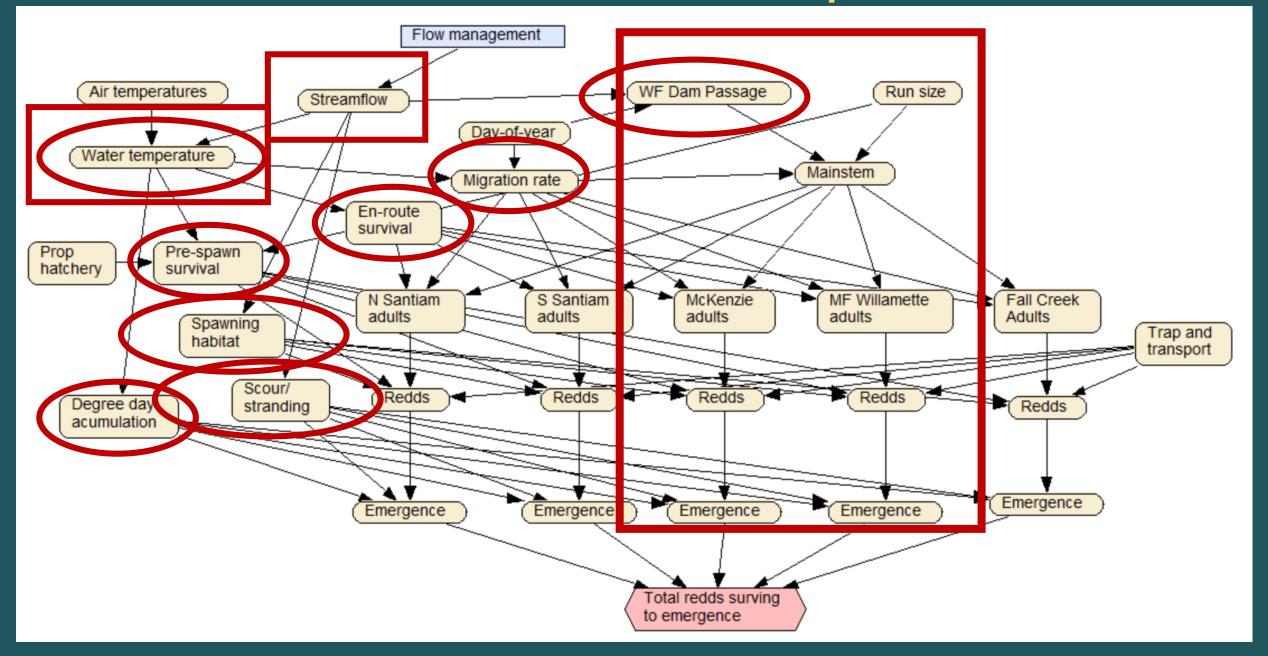

#### Chinook Salmon Conceptual Model

Arrows represent state transitions

Adults past Willamette Falls

#### Adult Chinook Salmon Conceptual Model

# Adult en-route and prespawn survival

Adults move through stream network

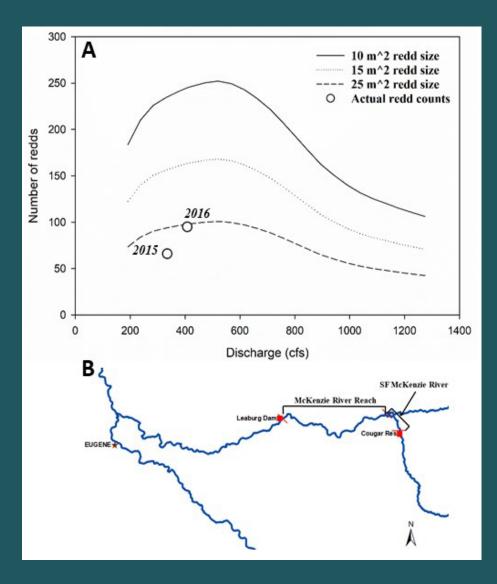

Accrue temperatures each segment, survival ~ *f*(time in segment, ave. temperature segment)

Random proportion trapped and transported (out of model) based on U of I telemetry studies

Remaining adults stay below projects accrue degree days

Adult survival ~ *f*(degree days) from PSM studies

# **Adult Chinook Spawning**

Spawning September weeks 2,3,4 (triangle distribution) Redd capacity ~ *f*(streamflows) 60/40 sex ratio, 9.5 m<sup>2</sup> redd size Number redds = min(capacity, no. females)

#### **Chinook Salmon Conceptual Model**

#### Arrows represent Adults past Willamette Falls state transitions Movement and survival survival & survival & Incubation survival & survival & survival & Survival and growth growth growth growth success growth egg-laying Juveniles Juveniles Juveniles Juveniles Juveniles Adults in Fry 105-120 >120mm 90-105 mm Deposited ed 75-90 mm 60-75 mm IS tributaries (< 60 mm) Movement Movement Movement Movement Movement Movement Juveniles Juveniles Juveniles Juveniles **Juveniles** Fry >120mm 105-120 Downstream reaches 90-105 mm 75-90 mm 60-75 mm (< 60 mm) Movement Movement Movement Movement Movement Movement Juveniles Juveniles Juveniles Juveniles Juveniles Willamette Falls Fry >120mm 105-120 75-90 mm 90-105 mm 60-75 mm (< 60 mm) Adult equivalents

# Juvenile growth, movement, survival

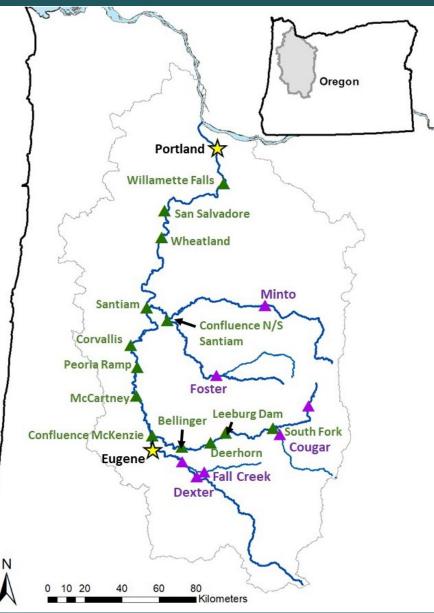

17 reaches

Flow habitat – all mainstem

N. & S. Santiam (McKenzie) PHSBSIM estimates (placeholders)

User specified yearling Chinook occupy available habitat in natal reaches

Chinook fry emergence in natal reaches ~*f*(degree days)

# Juvenile growth, movement, survival

Fill available habitats, habitat capacity ~f(flow, fish body size)
Habitat capacity < habitat needed (2 alternatives):
<ol>
\*move to downstream segment
density dependent mortality

Grow ~ *f*(temperature)

Survival ~ f(temperature, body size, segment)

Seasonal movement

Subyearlings leave Mar-Jul length, 105-120 mm size group Yearlings > 120 mm size group leave Oct->Apr

All remaining yearlings leave Apr

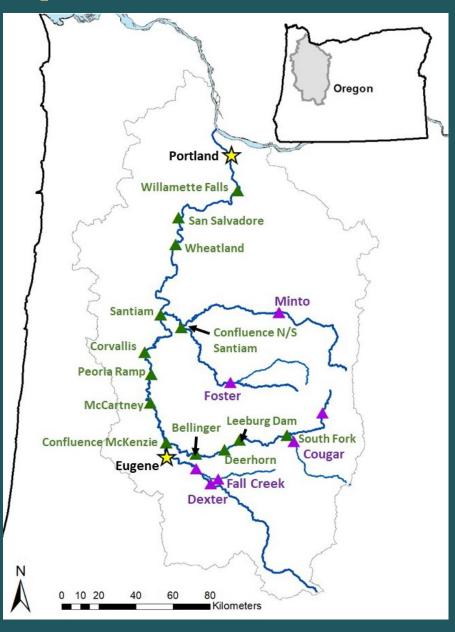

# Physical models and inputs

#### 17 Reaches

#### Inputs:

-Q @ 5 USACE projects -Air temperature NOAA stations

Streamflow models ~ f(upstream gage Q)H<sub>2</sub>O temperature ~ f(Q, Air Temperature)Spawning habitat ~ f(Q, redd size)Redd stranding/scour ~ f(Q)Rearing habitat ~f(Q)

### **Adult Submodel Calibration**

2008-2017

Observed Q USGS gages Air Temperature Run size Proportion hatchery origin

Minimize differences observed vs predicted number redds

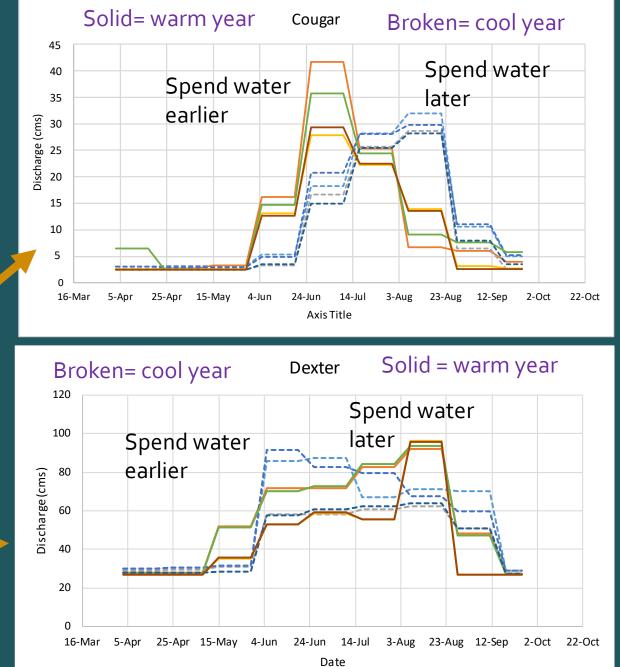

# Calibration: Estimated number of redds

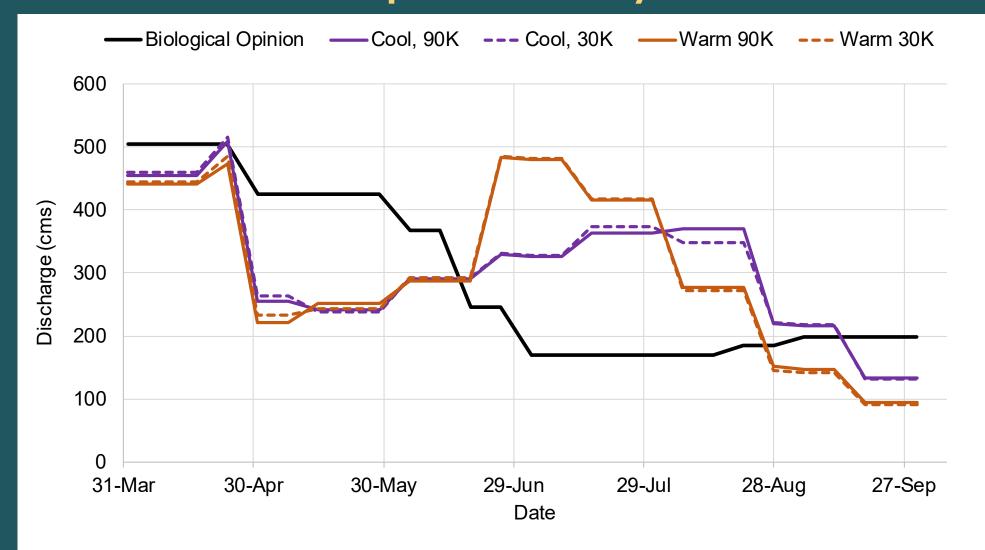

Finding the best flow regimes Constrain available water Each USACE project Water Years: Deficit, Adequate Water management season: April 1-October 1 Climate year: cool (2011) & warm (2015) Find optimal allocation over time, 3 week periods Base flows Management flows Maximize number emergence redds (adult submodel) and adult equivalents (juvenile submodel) Nonlinear Optimization with Constraints (*NlcOptim*)

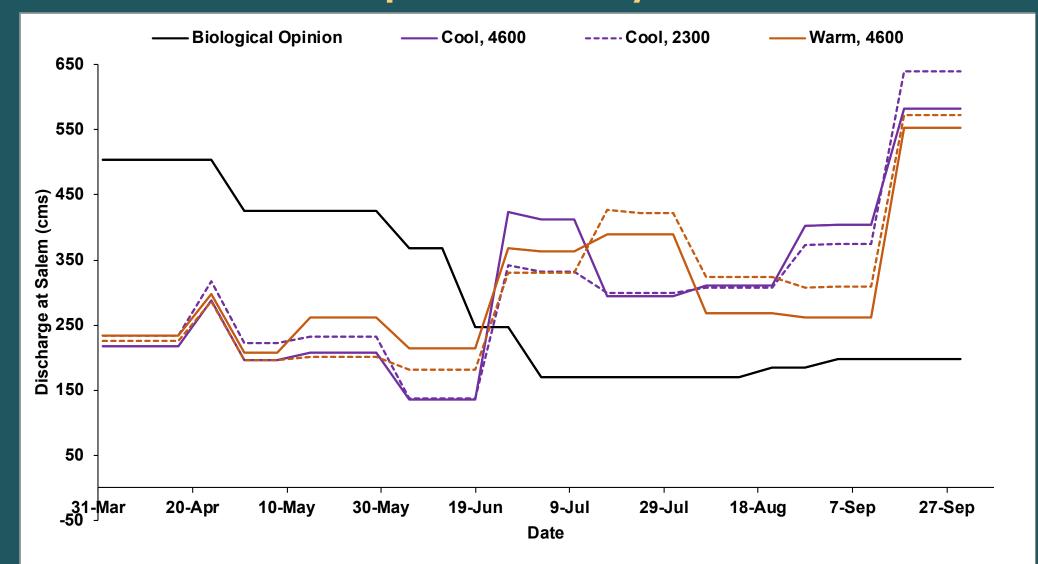

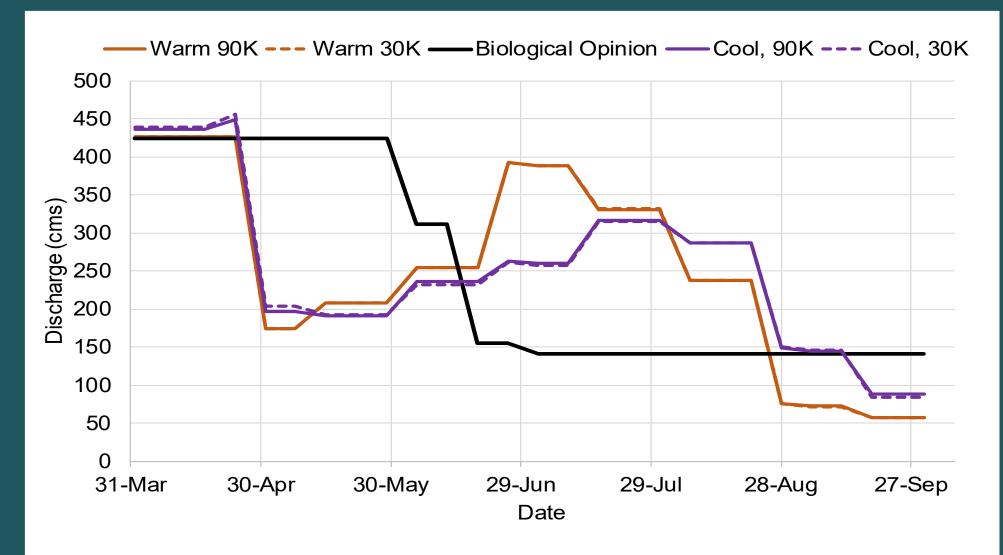

#### Estimated optimal adult flow regimes vs BiOp flows Adequate water year

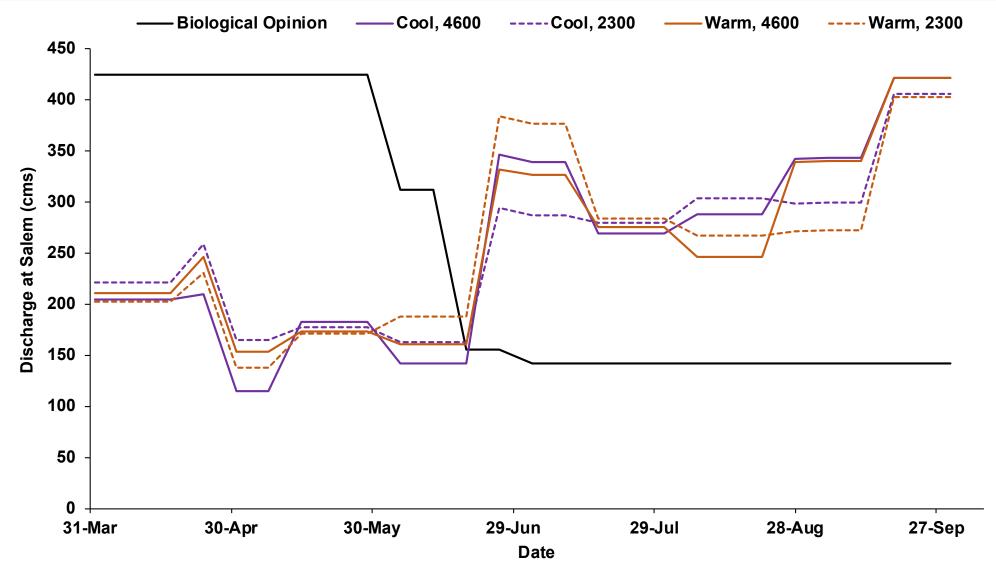

#### Estimated optimal *juvenile* flow regimes vs BiOp flows Adequate water year

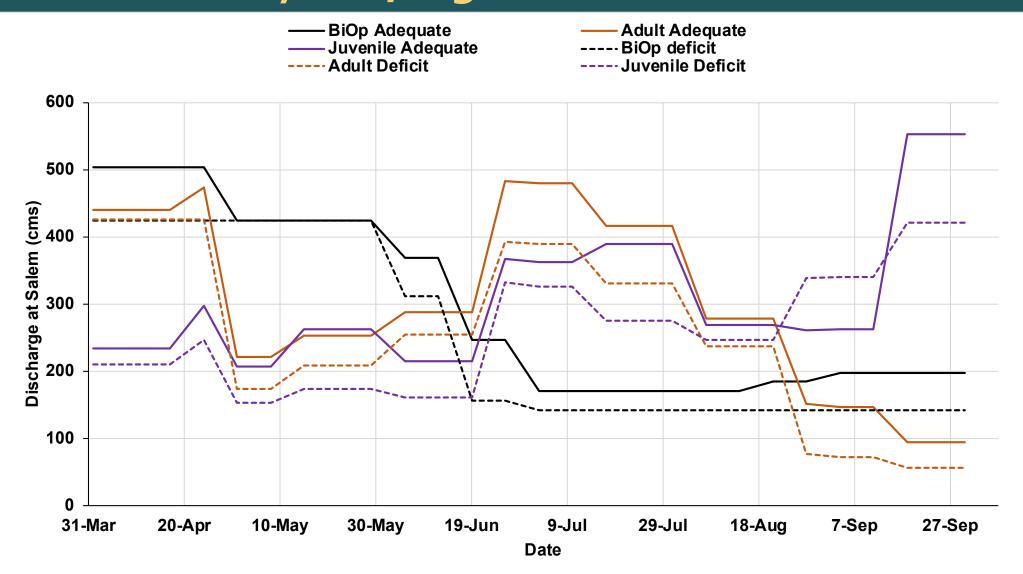

#### Estimated adult optimal flow regimes vs BiOp flows Deficit water year

#### Estimated juvenile optimal flow regimes vs BiOp flows Deficit water year

#### Estimated optimal flow regimes vs BiOp flows Warm years, high run size and redds

### Conclusions

Can use decision models to identify optimal flow regimes (other management actions)

Basis flow management strategy, tradeoffs

Ideally, integrated with flow management operations models (ReSim)

Next steps

Chinook: incorporate trib. habitat, update survival, and calibrate Integrate Steelhead and Oregon Chub Uncertainty and sensitivity
