

# Can rapid genetic assessment (RGA) improve passage decisions at Willamette basin dams?

Implications for reintroduction of spring-run Chinook salmon  
in the South Santiam River

Dan Bingham, Hans Berge, Scott Blankenship, and Gregg Schumer  
Cramer Fish Sciences, Genidaqs

# What is needed to recover spring-run Chinook salmon in the Willamette?

- Create self-sustaining populations upstream stream of dams

# What is needed to recover spring-run Chinook salmon in the Willamette?

- Create self-sustaining populations upstream stream of dams
- Cohort Replacement Rate (CRR) > 1.00

# What is needed to recover spring-run Chinook salmon in the Willamette?

- Create self-sustaining populations upstream stream of dams
- Cohort Replacement Rate (CRR) > 1.00
- We need to know the origin of returning adults to achieve CRR>1.00

# The power of genetic baselines

- Genetic baselines allow us to query existing data to identify population of origin

# The power of genetic baselines

- Genetic baselines allow us to query existing data to identify population of origin
  - Allele frequencies from local populations
  - Archived tissues from transported adults
  - Archived tissues from hatchery brood (PBT)

# The power of genetic baselines

- Genetic baselines allow us to query existing data to identify population of origin
  - Allele frequencies from local populations
  - Archived tissues from transported adults
  - Archived tissues from hatchery brood (PBT)
- Rapid genetic assessment (RGA) harnesses the power of genetic baselines in real-time

# Real-time

# Real-time

- Genetic data is available to inform a specific management action during a specific management event.

# Real-time

- Genetic data is available to inform a specific management action during a specific management event.
- Example:
  - RGA is used to inform selective transport of natural-origin fish in a reintroduction program

# What is needed to complete RGA?

- Genetic baseline

# What is needed to complete RGA?

- Genetic baseline
  - i.e., Archived tissues

# What is needed to complete RGA?

- Genetic baseline
  - i.e., Archived tissues
- Logistics: management event and action need to be feasible in real-time
  1. Capture
  2. Tag
  3. Sample
  4. Mail
  5. Hold
  6. Genetic Analysis (24 to 48 hrs)
  7. Sort
  8. Release

# What are examples of RGA?

**Table 1.** Examples of RGA programs.

<b>RGA Program</b>	<b>Species</b>	<b>Timeframe (hrs)</b>	<b>Purpose</b>
USBOR	Chinook	24 to 48	ID of run of Chinook salmon salvaged at Central Valley Project
USFWS	Chinook	24 to 48	ID of Endangered Winter Run Chinook in Sacramento River
Avista Power	Bull trout	24 to 48	ID of population of origin in Pend Oreille (trap and haul)
USFWS	Bull trout	24 to 48	ID of population of origin in NF Tieton River
WGF	Sauger	24 to 48	ID of hybridization with nonnative walleye for hatchery breeding

# What are examples of RGA?

**Table 1.** Examples of RGA programs.

<b>RGA Program</b>	<b>Species</b>	<b>Timeframe (hrs)</b>	<b>Purpose</b>
USBOR	Chinook	24 to 48	ID of run of Chinook salmon salvaged at Central Valley Project
USFWS	Chinook	24 to 48	ID of Endangered Winter Run Chinook in Sacramento River
Avista Power	Bull trout	24 to 48	ID of population of origin in Pend Oreille (trap and haul)
USFWS	Bull trout	24 to 48	ID of population of origin in NF Tieton River
WGF	Sauger	24 to 48	ID of hybridization with nonnative walleye for hatchery breeding

# Water reallocation for winter-run Chinook Salmon, CA

- Real-time GSI is used to confirm entrainment of Endangered Chinook in the CVP

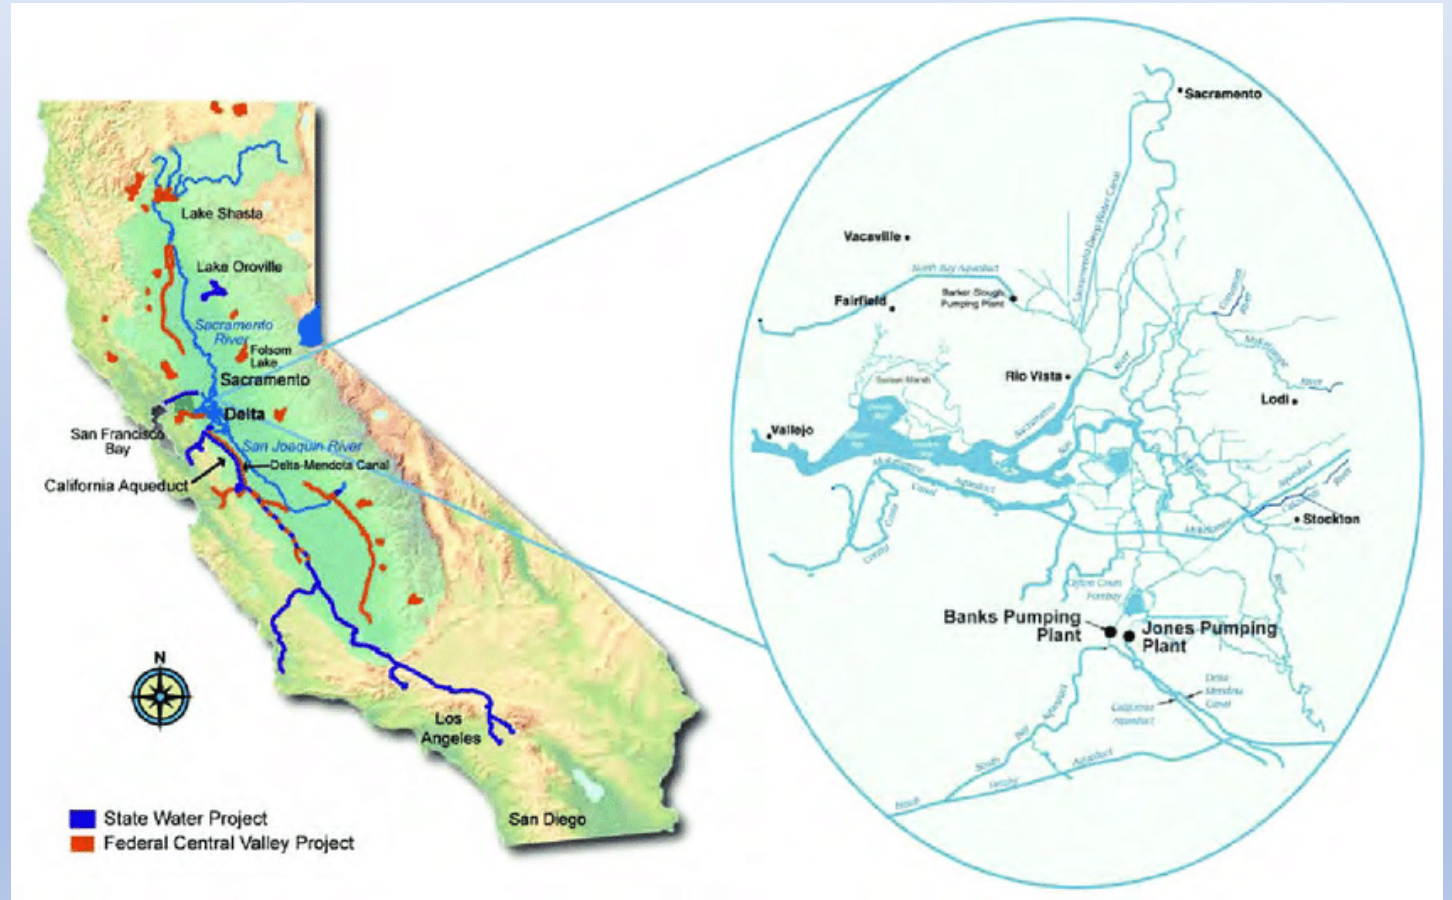

# Water reallocation for winter-run Chinook Salmon, CA

- Real-time GSI is used to confirm entrainment of Endangered Chinook in the CVP
- The genetic baseline is allele frequencies from local populations

# Water reallocation for winter-run Chinook Salmon, CA

- Real-time GSI is used to confirm entrainment of Endangered Chinook in the CVP
- The genetic baseline is allele frequencies from local populations
- The management event is fish salvage
- The management action is reallocation of water if WRCS are present

# Water reallocation for winter-run Chinook Salmon, CA

- Real-time GSI is used to confirm entrainment of Endangered Chinook in the CVP
- The genetic baseline is allele frequencies from local populations
- The management event is fish salvage
- The management action is reallocation of water if WRCS are present
- No water curtailment since inception of RGA

# How is RGA used?

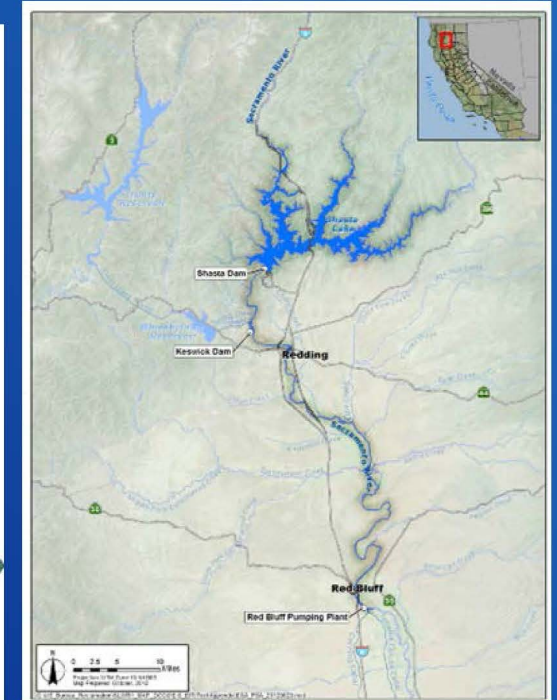

**Table 1.** Examples of RGA programs.

<b>RGA Program</b>	<b>Species</b>	<b>Timeframe (hrs)</b>	<b>Purpose</b>
USBOR	Chinook	24 to 48	ID of run of Chinook salmon salvaged at Central Valley Project
USFWS	Chinook	24 to 48	ID of Endangered Winter Run Chinook in Sacramento River
Avista Power	Bull trout	24 to 48	ID of population of origin in Pend Oreille (trap and haul)
USFWS	Bull trout	24 to 48	ID of population of origin in NF Tieton River
WGF	Sauger	24 to 48	ID of hybridization with nonnative walleye for hatchery breeding

# Broodstock program for winter-run Chinook salmon at Shasta Dam

- Real-time GSI ensures propagation of winter-run Chinook and avoidance of inbreeding in the hatchery

## Geographic Location

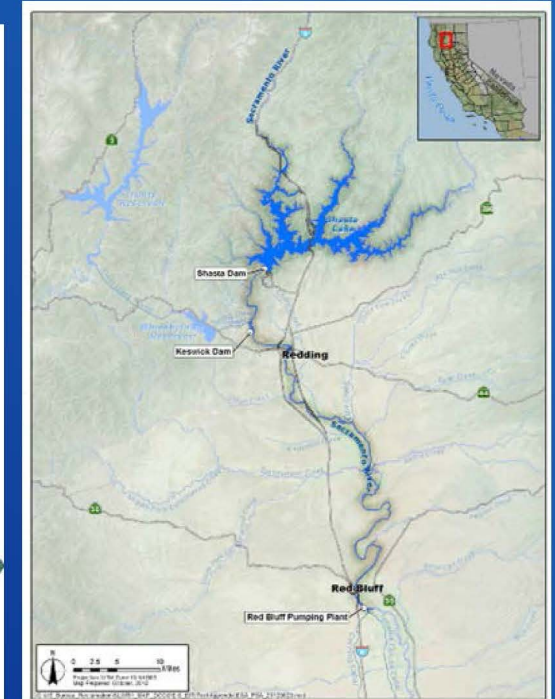

RECLAMATION

# Broodstock program for winter-run Chinook salmon at Shasta Dam

- Real-time GSI ensures propagation of winter-run Chinook and avoidance of inbreeding in the hatchery
- Genetic baseline is allele frequencies from local populations and genotypes from parents

## Geographic Location

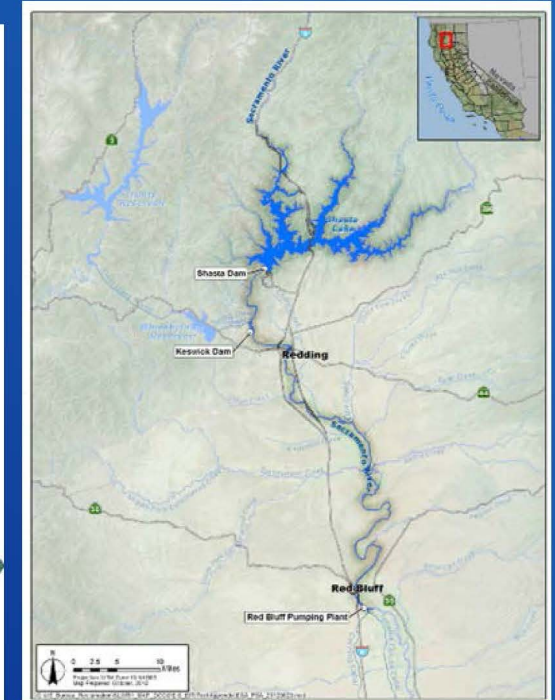

RECLAMATION

# Broodstock program for winter-run Chinook salmon at Shasta Dam

- Real-time GSI ensures propagation of winter-run Chinook and avoidance of inbreeding in the hatchery
- Genetic baseline is allele frequencies from local populations and genotypes from parents
- The management event is hatchery supplementation of the local WR population
- The management action is selective use of winter-run Chinook for broodstock, avoidance of inbreeding, and live-release of Non-WR

## Geographic Location

RECLAMATION

# Broodstock program for winter-run Chinook salmon at Shasta Dam

- Real-time GSI ensures propagation of winter-run Chinook and avoidance of inbreeding in the hatchery
- Genetic baseline is allele frequencies from local populations and genotypes from parents
- The management event is hatchery supplementation of the local WR population
- The management action is selective use of winter-run Chinook for broodstock, avoidance of inbreeding, and live-release of Non-WR
- The ecological benefit is supplementation of the natural WR population and live release of non-WR

## Geographic Location

RECLAMATION

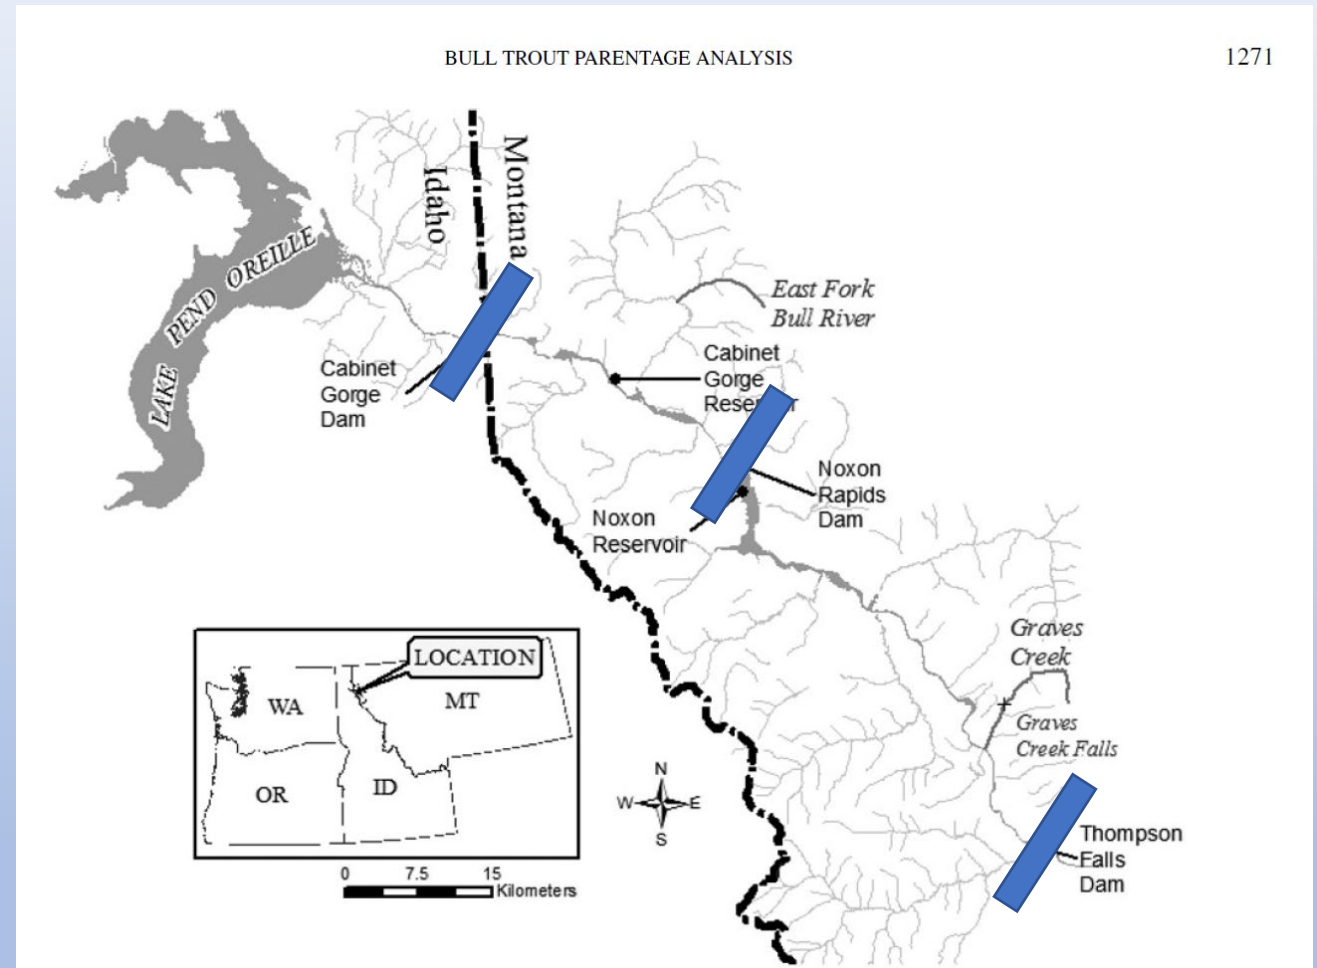

# What are examples of RGA?

**Table 1.** Examples of RGA programs.

<b>RGA Program</b>	<b>Species</b>	<b>Timeframe (hrs)</b>	<b>Purpose</b>
USBOR	Chinook	24 to 48	ID of run of Chinook salmon salvaged at Central Valley Project
USFWS	Chinook	24 to 48	ID of Endangered Winter Run Chinook in Sacramento River
Avista Power	Bull trout	24 to 48	ID of population of origin in Pend Oreille (trap and haul)
USFWS	Bull trout	24 to 48	ID of population of origin in NF Tieton River
WGF	Sauger	24 to 48	ID of hybridization with nonnative walleye for hatchery breeding

# Bull Trout in the Pend Oreille River, ID

- Real-time GSI is used to confirm the number of dams that adfluvial bull trout must be passed above for spawning

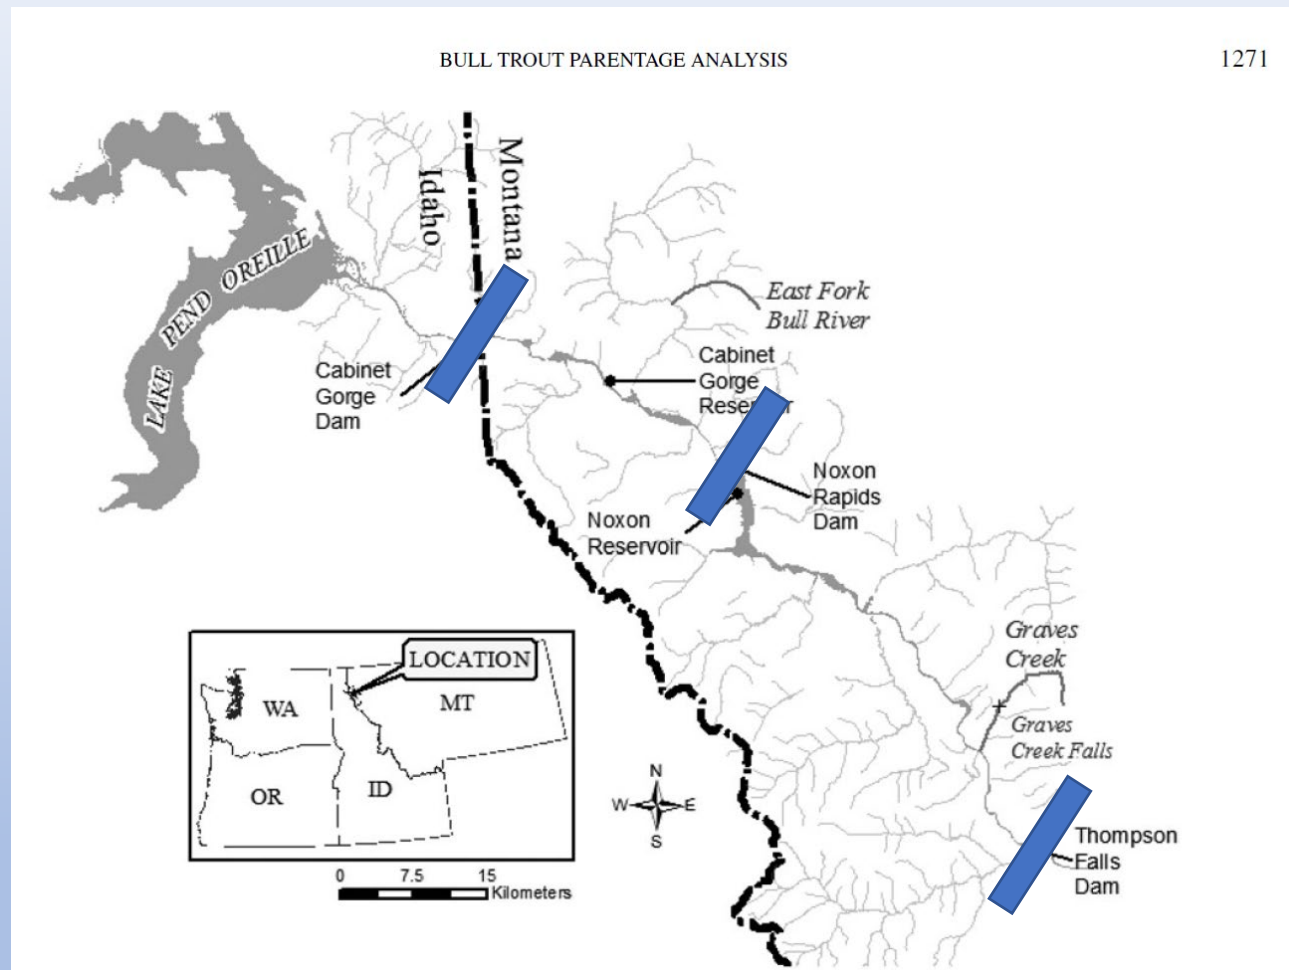

# Bull Trout in the Pend Oreille River, ID

- Real-time GSI is used to confirm the number of dams that adfluvial bull trout must be passed above for spawning
- The genetic baseline is allele frequencies from ~40 local populations

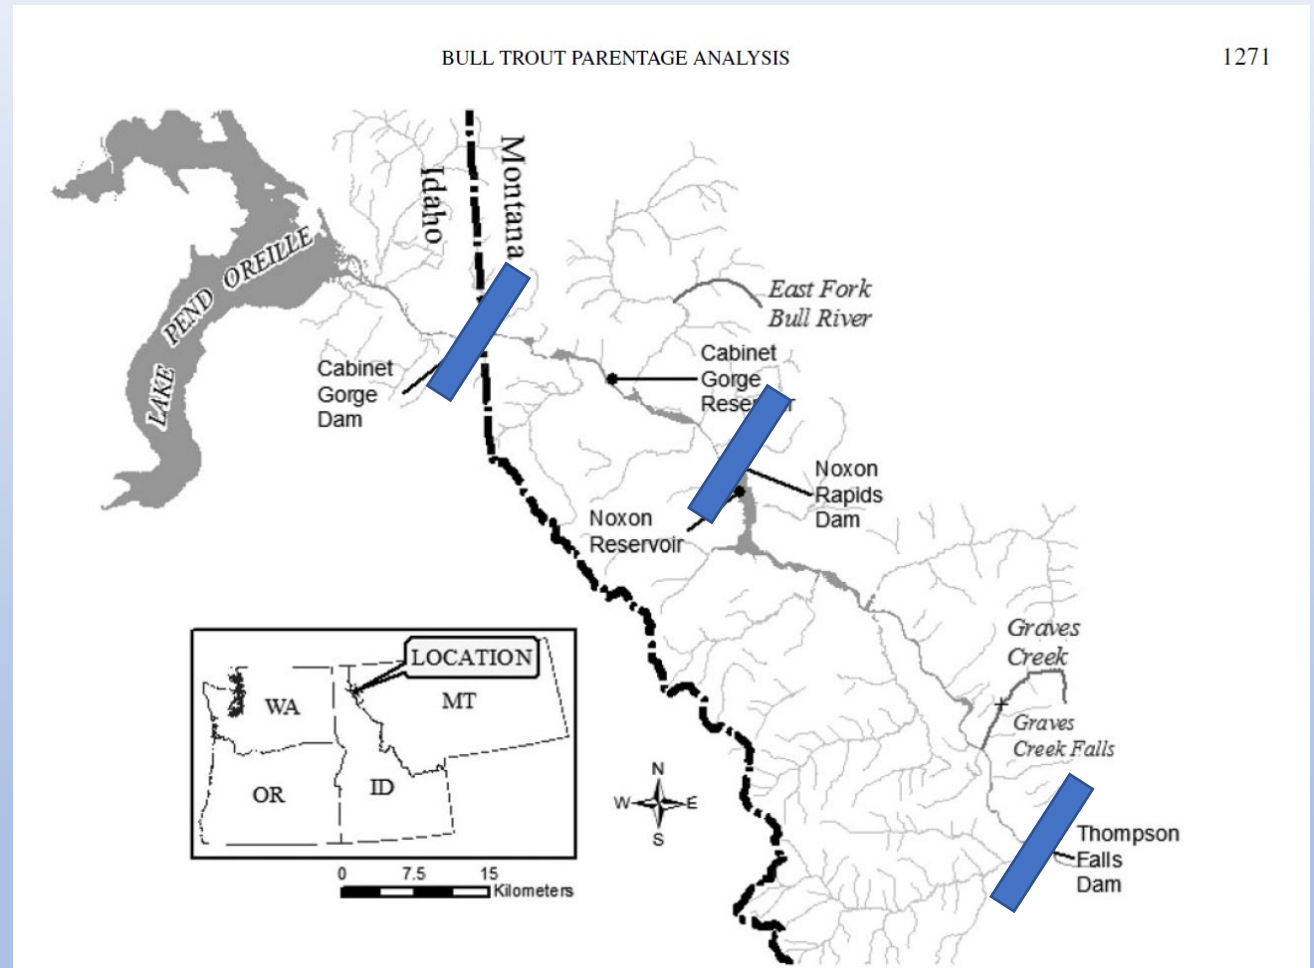

# Bull Trout in the Pend Oreille River, ID

- Real-time GSI is used to confirm the number of dams that adfluvial bull trout must be passed above for spawning
- The genetic baseline is allele frequencies from ~40 local populations
- The specific management event is upstream transport of bull trout

# Bull Trout in the Pend Oreille River, ID

- Real-time GSI is used to confirm the number of dams that adfluvial bull trout must be passed above for spawning
- The genetic baseline is allele frequencies from ~40 local populations
- The specific management event is upstream transport of bull trout
- The specific management action is transport to tributary of origin

# Bull Trout in the Pend Oreille River, ID

- Real-time GSI is used to confirm the number of dams that adfluvial bull trout must be passed above for spawning
- The genetic baseline is allele frequencies from ~40 local populations
- The specific management event is upstream transport of bull trout
- The specific management action is transport to tributary of origin
- The ecological benefit is confirmed reproductive success by transported adult bull trout

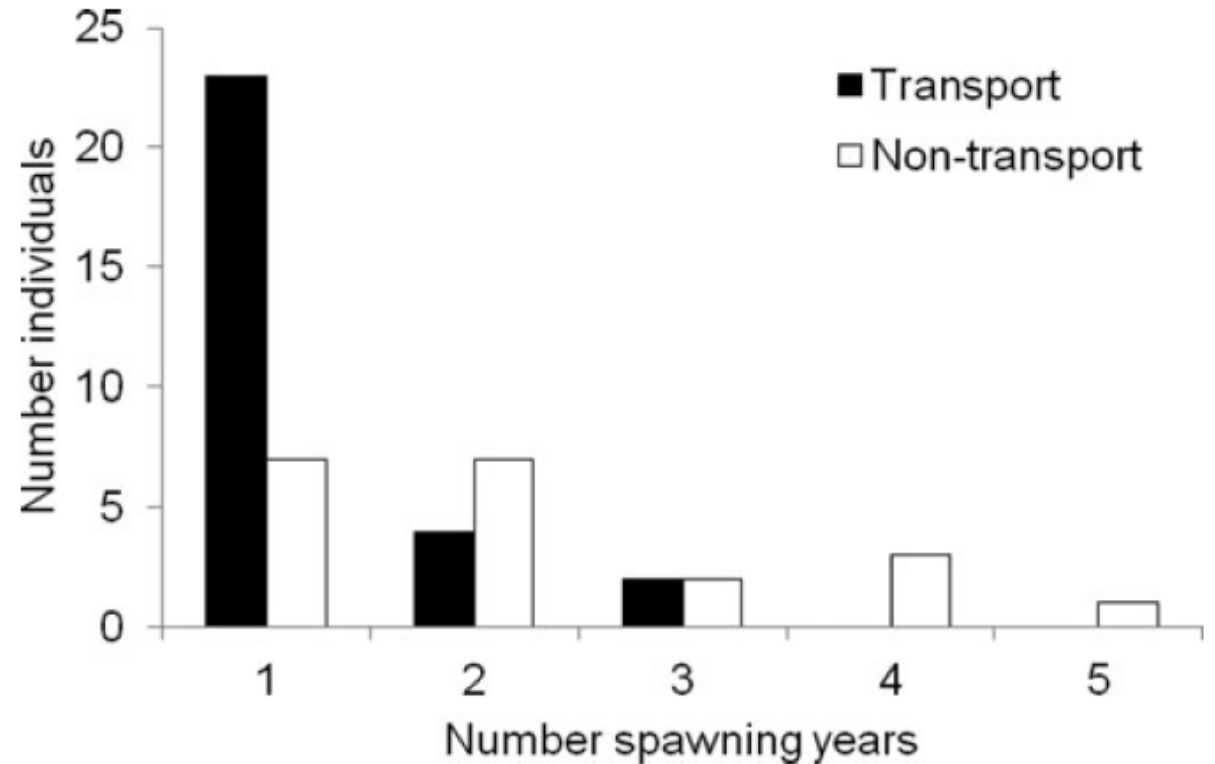

FIGURE 3. Spawning frequency based on parentage assignments for adult Bull Trout in East Fork Bull River and Graves Creek. Black bars represent upstream transport fish and white bars represent nontransport fish.

# RGA and reintroduction of spring-run Chinook Salmon: South Santiam

# RGA and reintroduction of spring-run Chinook Salmon: South Santiam

- 85% of production occurred  
upstream of Foster (2016 HGMP)

# RGA and reintroduction of spring-run Chinook Salmon: South Santiam

- 85% of production occurred upstream of Foster (2016 HGMP)
- 2008 BiOp identified access to historical spawning habitat as a key factor limiting natural production and recovery

# RGA and reintroduction of spring-run Chinook Salmon: South Santiam

- 85% of production occurred upstream of Foster (2016 HGMP)
- 2008 BiOp identified access to historical spawning habitat as a key factor limiting natural production and recovery
- Trap-and-haul reintroduction program for spring-run Chinook (RPA 4.6 2008 BiOp)

# Goals and Challenges of the Reintroduction Program

# Goals and Challenges of the Reintroduction Program

- Goal of reintroduction is to exclude hatchery-origin spring Chinook (pHOS=0.00) (2016 HGMP)

# Goals and Challenges of the Reintroduction Program

- Goal of reintroduction is to exclude hatchery-origin spring Chinook (pHOS=0.00) (2016 HGMP)
- However, as many as 30% of passed unmarked spring Chinook have been of hatchery-origin (2016 HGMP)

# Goals and Challenges of the Reintroduction Program

- Goal of reintroduction is to exclude hatchery-origin spring Chinook (pHOS=0.00) (2016 HGMP)
- However, as many as 30% of passed unmarked spring Chinook have been of hatchery-origin (2016 HGMP)
- A future goal is to create a self-sustaining population upstream of Green Peter (CRR>1.00) (2016 HGMP)

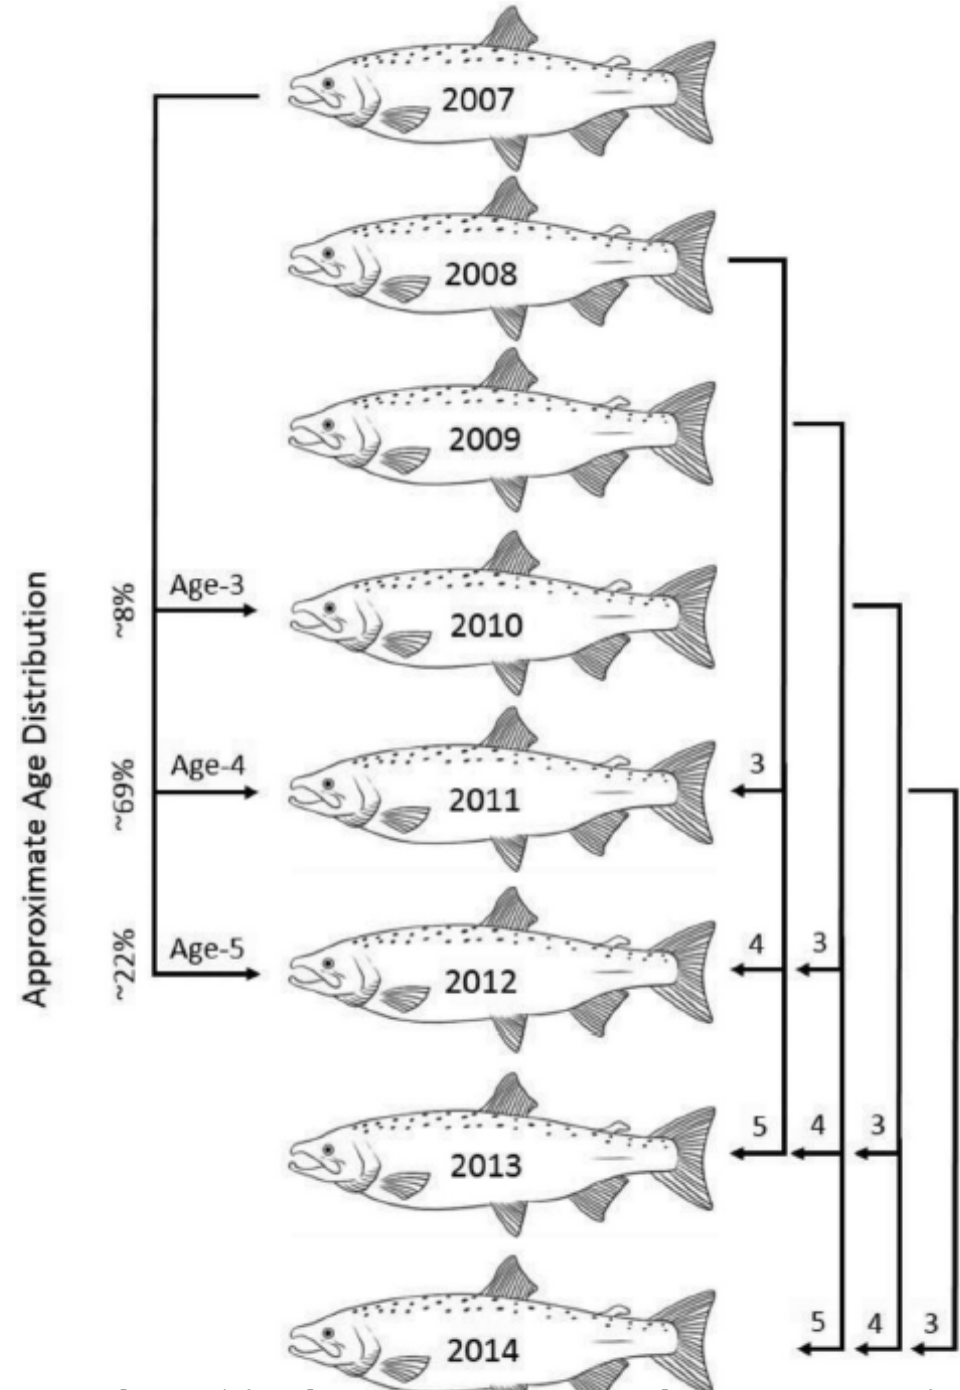

# Goals and Challenges of the Reintroduction Program

- Goal of reintroduction is to exclude hatchery-origin spring Chinook (pHOS=0.00) (2016 HGMP)
- However, as many as 30% of passed unmarked spring Chinook have been of hatchery-origin (2016 HGMP)
- A future goal is to create a self-sustaining population upstream of Foster Reservoir (CRR>1.00) (2016 HGMP)
- However, identification of natal natural-origin spring Chinook is a challenge

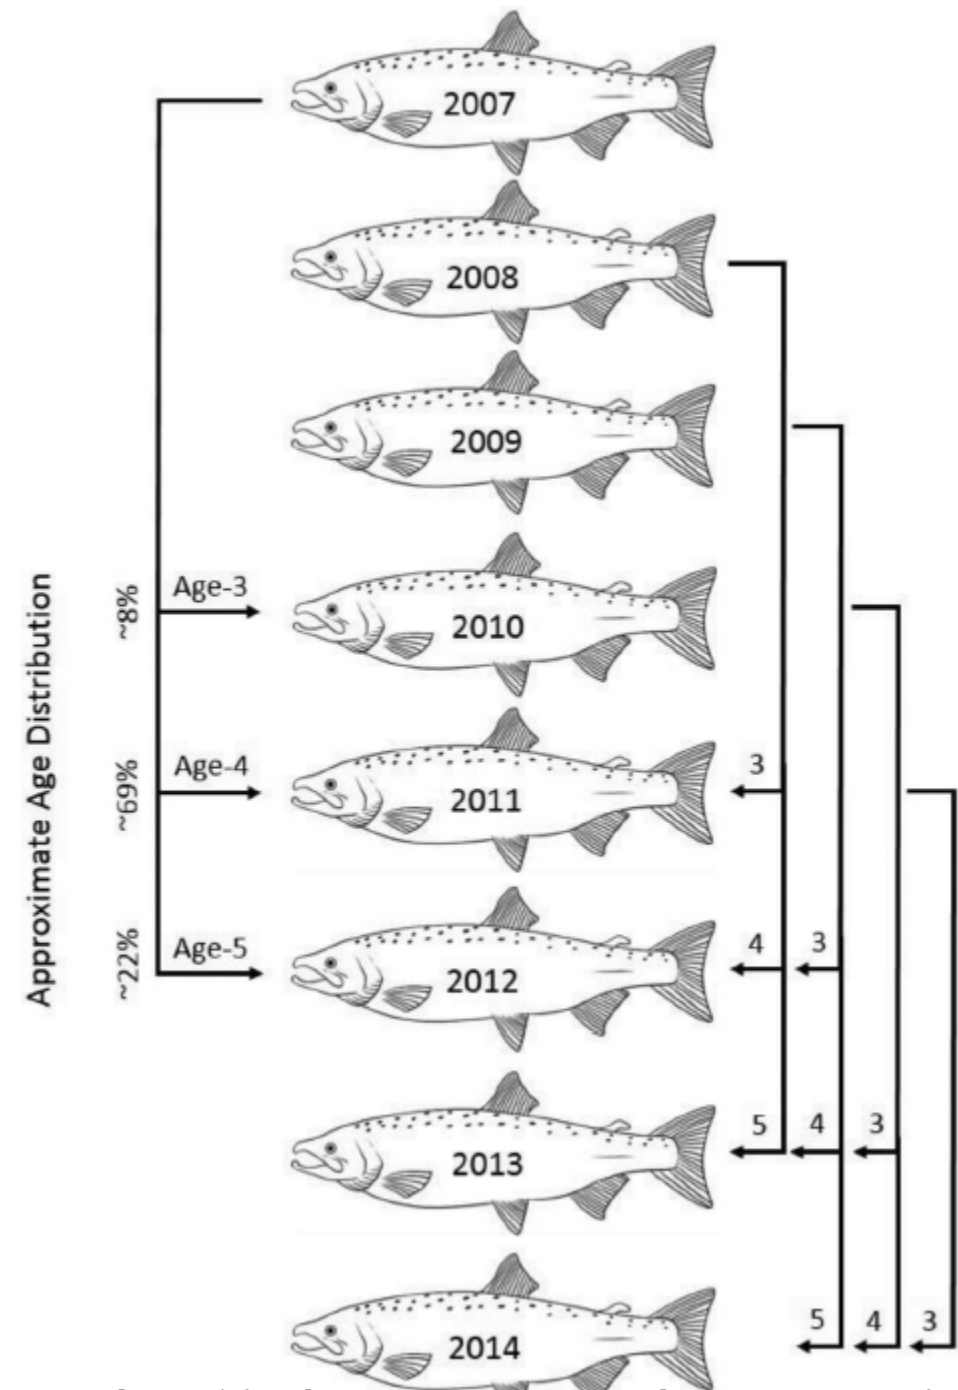

# What is needed to use RGA at Foster and Green Peter?

# What is needed to use RGA at Foster and Green Peter?

- A genetic baseline
  - Archived tissues are available from hatchery brood stock for last three years
  - Archived tissues are available from passed unmarked fish for >10 years

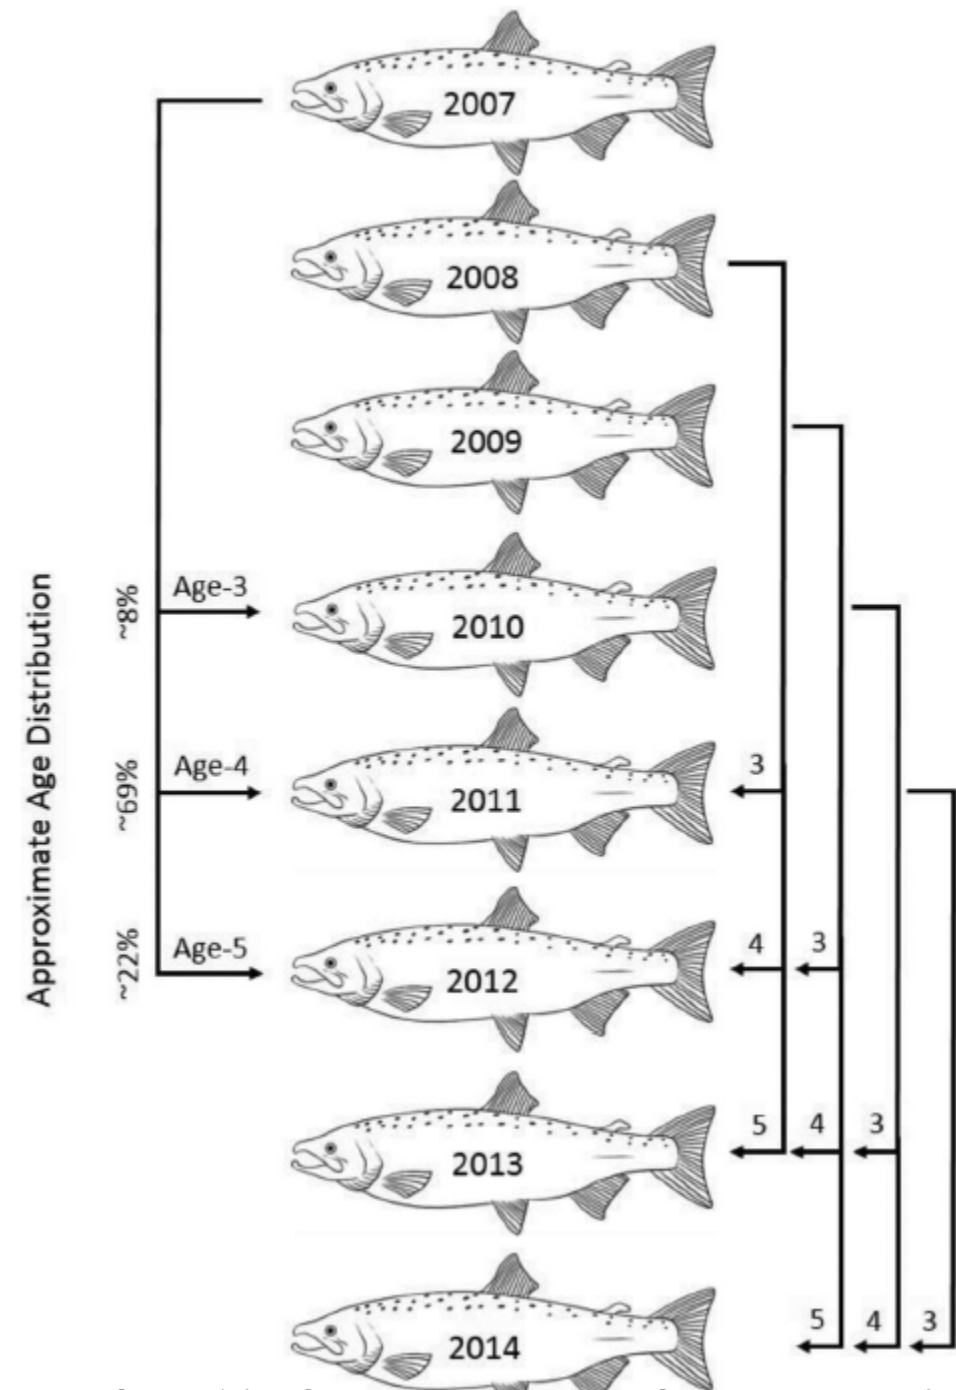

# What is needed to use RGA at Foster and Green Peter?

- A genetic baseline
  - Archived tissues are available from hatchery brood stock for last three years
  - Archived tissues are available from passed unmarked fish for >10 years

# What is needed to use RGA at Foster and Green Peter?

- A genetic baseline
  - Archived tissues are available from hatchery brood stock for last three years
  - Archived tissues are available from passed unmarked fish for >10 years
- The management event and action need to be possible in real-time
