BULK MARKING SCHEDULE

Table 1. Tentative release schedule for brood years 2022 and 2023. Green rows highlight the release groups that have been tagged and released so far this year. Orange rows highlight release groups that have been tagged but have not yet been released. Date estimate is a rough estimate of when fish should be released to meet the intended target.

BULK MARKING SUMMARY

The majority of the last reporting period was used to wrap up repairs and refurbishments on the tagging trailer and associated equipment. North Santiam stock juvenile Chinook salmon at Marion Forks reached approximately 45 millimeters forklength on May 13th. Therefore, Cramer began adipose clipping and tagging a total of 15,000 juvenile Chinook salmon on May 13th. Those 15,000 fish were released on May 20th at the head of Detroit Reservoir split evenly between the North Santiam and Breitenbush rivers. Details pertaining to those release groups will be presented in the next edition of the bi-weekly report as the vast majority of the work took place after May 15th.

Recaptures

A total of 210 fish from this project were both detected and uploaded to PTAGIS during the most reporting period. The majority of the redetections or observations that were reported to PTAGIS came from locations on the Columbia River. A total of 116 fish from this project were redetected by the Columbia River Estuary Towed Array (TWX), 37 were observed at Columbia River Pile Dike Array 6, 29 at Pile Dike Array 5, and 25 at Pile Dike Array 8. We estimate that a total of 4,655 PIT tags from this project have been detected since we began releasing fish in May of 2023 (Table 4).

Table 2. Bulk marking summary statistics. Total number of fish marked (N), mean fork length (FL), mean weight, start date of marking, end date of marking, total mortalities from start of tagging to release, mortality percentage, total shed tags from start of tagging to release, and shed tag percentage.

RESERVOIR DISTRIBUTION SUMMARY

Reservoir sampling during the reporting period was conducted in the nearshore of Lookout Point and Green Peter reservoirs using Oneida lake traps and box minnow traps (Table 5). Reservoirs were sampled on alternating weeks.

During this reporting period, Lookout Point Reservoir was sampled 4/29/2024 – 5/02/2024 and 5/13/2024-5/16/2024 (Table 5). Catch and limnology for 4/29/2024 – 5/02/2024 were reported in the previous biweekly report (reporting period 4/16/2024-4/30/2024). During week 20 (5/13/2024 – 5/16/2024), sampling consisted of three days of 24-hour trap sets, requiring four days on the water. One Oneida trap and 3 box minnow traps were set in each reservoir longitudinal zone per day (Lower, Middle, Upper). Traps were set at the surface in each reservoir zone. Surface temperatures at trap locations that week averaged 16.1 C (Table 6, Figure 1). Over three days of sampling (n=9 Oneida sets, n=27 box minnow sets), 2 natural origin Chinook salmon fry, 6 yearling/age 1+ *O. mykiss* (5 natural origin and one adipose clipped hatchery fish), 5 juvenile northern pikeminnow, and two adult bluegill were captured (Tables 7-9). One of the Chinook salmon fry was implanted with a PIT tag, the other was a mortality. Four natural origin *O. mykiss* and one hatchery *O. mykiss* were implanted with PIT tags. One natural origin *O. mykiss* was a mortality.

Green Peter Reservoir was sampled this reporting period from 5/8/2024 through 5/10/2024 (Table 5). Effort consisted of two days of 24-hour trap sets, requiring 3 days on the water. One Oneida trap and 3 box minnow traps were set in each reservoir longitudinal zone per day. Traps were set at the surface in each reservoir zone (Lower, Middle, Upper, Quartzville). Surface temperatures at trap locations averaged 15.1 C (Table 6, Figure 2). Over two days of sampling (n=8 Oneida sets, n=20 box minnow sets), one subyearling natural origin Chinook salmon, one yearling natural origin *O. mykiss*, three juvenile northern pikeminnow and five bluegill were captured (Tables 7-9). The Chinook salmon and *O. mykiss* were implanted with PIT tags.

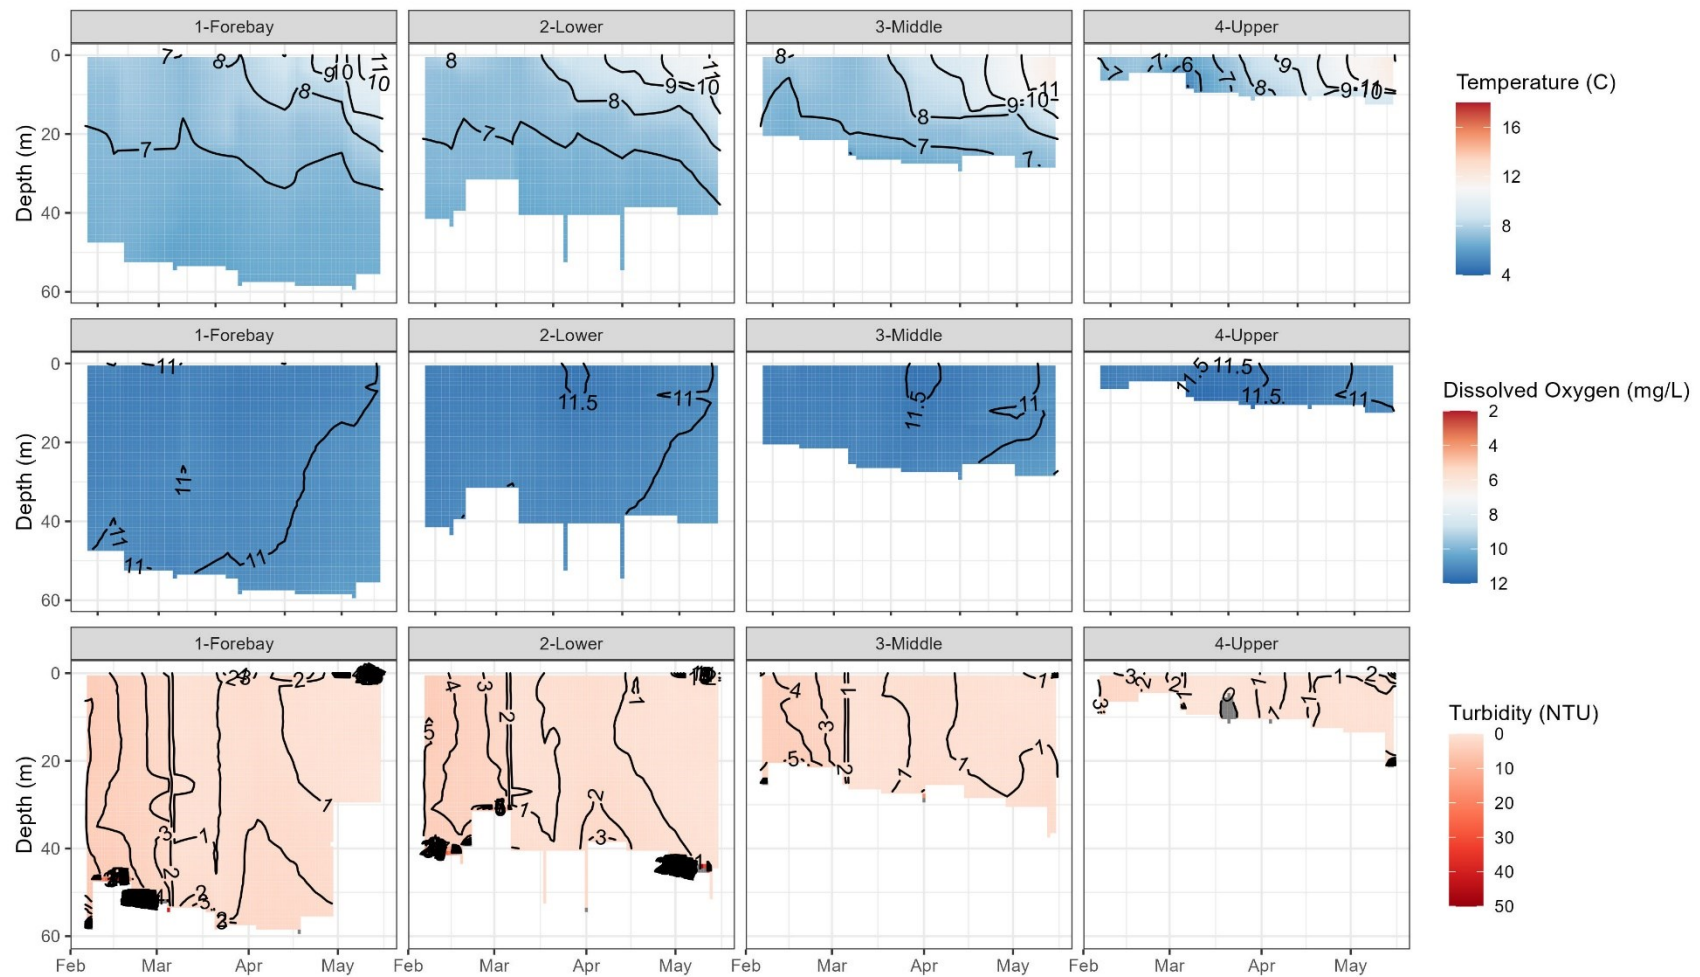

Figure 1. Lookout Point 2024 limnology data. Note that turbidity data in gray are suspect due to a sensor malfunction/calibration issue. Readings in gray were slightly negative (erroneous) but secchi measurements taken that week support that turbidity was near zero. The sensor has since been recalibrated.

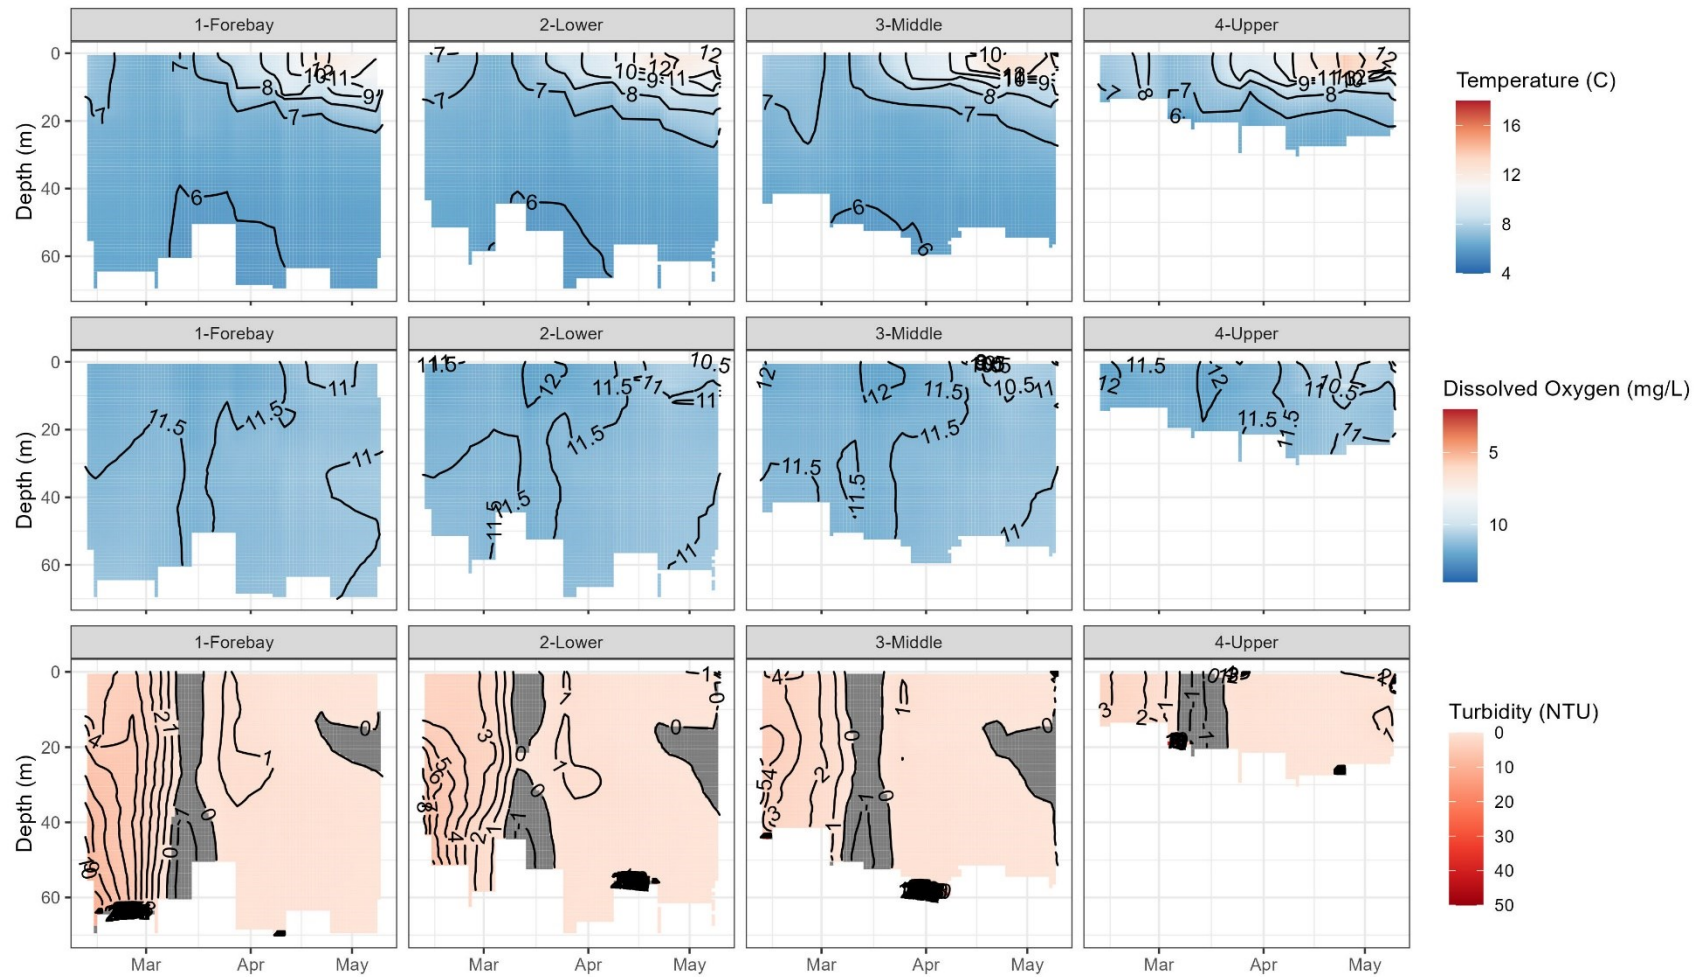

Figure 2. Green Peter 2024 limnology data. Note that turbidity data in gray (data collected week 11: March 11-14) are suspect due to a sensor malfunction/calibration issue. Readings in gray were slightly negative (erroneous) but secchi measurements taken those dates support that turbidity was near zero.
