# BULK MARKING SCHEDULE

Table 1. Tentative release schedule for brood years 2022 and 2023. Green rows highlight the release groups that have been tagged and released. Orange rows highlight release groups that have been tagged but have not yet been released. Date estimate is a rough estimate of when fish should be released to meet the intended target.

## **BULK MARKING SUMMARY**

---

All of the brood year 2023 South Santiam stock fish have been tagged and 18,000 (out of a total of 30,000) of the brood year 2023 North Santiam fish have been tagged. We are planning on tagging the remaining North Santiam fish mid-September. The next release is scheduled for late August at the Foster project. The Bulk Marking project is in a holding pattern until the releases commence in the fall.

### **Recaptures**

A single fish from this project was detected at Columbia Pile Dike Array 5 and uploaded to PTAGIS during the most reporting period. We estimate that a total of 5,028 PIT tags from this project have been detected since we began releasing fish in May of 2023 (Table 4).

Table 2. Bulk marking summary statistics. Total number of fish marked (N), mean fork length (FL), mean weight, start date of marking, end date of marking, total mortalities from start of tagging to release, mortality percentage, total shed tags from start of tagging to release, and shed tag percentage.

## RESERVOIR DISTRIBUTION SUMMARY

---

During the reporting period, reservoir sampling was conducted in the offshore environments of Lookout Point and Green Peter reservoirs using small mesh gill nets (3/8 – 1 inch) (Table 5). Both reservoirs were sampled weekly throughout the reporting period.

On Green Peter Reservoir, effort during the week of 8/5/2024 consisted of three days of 24-hour net sets, requiring four days on the water. Eight gill nets were set each day spread along the longitudinal axis of the reservoir at fixed sites (Lower: A1, A2; Middle: A3, A4; Upper: A5, A6; Quartzville: Q1). An additional rover net was set at different fixed sites each day to increase sample size, for a total of nine nets per day. One net became snagged on a submerged structure and was destroyed during retrieval on 8/7/2024. As a result, we did not have a rover net for the last day of this sampling week. Gill nets were set at 11m depth. Over 3 days of sampling (n=26 gill net sets), 3 Chinook salmon, 98 *O. mykiss*, 3, northern pikeminnow, 2 bluegill, 1 yellow bullhead and 9 smallmouth bass were captured (Tables 7-9). Target species catch one subyearling natural origin Chinook salmon, 2 subyearling hatchery origin Chinook salmon, 89 hatchery adult *O. mykiss*, 1 hatchery yearling *O. mykiss*, 5 natural origin adult *O. mykiss*, and 3 natural origin yearling *O. mykiss*.

On Green Peter the following week (week of 8/12/2024), effort once again consisted of three days of 24-hr sets on Green Peter (n=27 gill net sets). The catch consisted of 23 natural origin subyearling Chinook salmon, 1 hatchery origin PIT tagged Chinook salmon, 77 hatchery origin *O. mykiss*, 10 natural origin adult *O. mykiss*, 3 natural origin yearling *O. mykiss*, 1 bluegill, 1 yellow bullhead, 1 largescale sucker, and 7 smallmouth bass. Nets were set at 12m depth to target 15C on the thermal profile (Figure 2).

Sampling effort on Lookout Point Reservoir was restricted to the lower zone due to the thermocline being down at 30 meters, shallow water depths in the upper and middle zones, and high non-target catches of juvenile smallmouth bass and crappie. The high non-target catch led to a work stoppage while take limits were adjusted on the research permit. The week of 8/5/2024 ended up consisting of two days of 24-hour trap sets, requiring three days on the water. Gill nets were set at stations A1-A3 at a depth of 18m. Over two days of sampling (n=7 gill net sets), 7 Chinook salmon, 2 *O. mykiss*, 514 smallmouth bass, 5 largemouth bass, and 546 white crappie were captured. All seven of the Chinook salmon were of hatchery origin and were not recaptures.

Lookout Point sampling effort the following week (week of 8/12/2024) continued to be restricted to the lower zone but consisted of three days of 24-hour sets (n = 10 gill net sets). Gill nets were set between 16 – 32 meters of depth depending on the location of the thermocline. Catch consisted of 14 Chinook salmon, 12 *O. mykiss*, 880 smallmouth bass, 3 largemouth bass, 608 black crappie, and 2,875 white

crappie. Target species catch consisted of 11 hatchery subyearling Chinook (no recaptures), 1 natural origin subyearling Chinook, 2 hatchery adult *O. mykiss*, and 10 adult natural origin *O. mykiss*.

No Chinook recaptures were encountered and no target species were tagged during this reporting period as surface temperatures at capture locations exceeded 17C, the upper limit for tagging as directed by our sampling permit.

\*One recaptured fish was inadvertently tagged with a 2<sup>nd</sup> PIT tag. \*\* Not tagged, awaiting permit modification to allow for tagging RBT (modification has since been granted effective 4/16/2024).

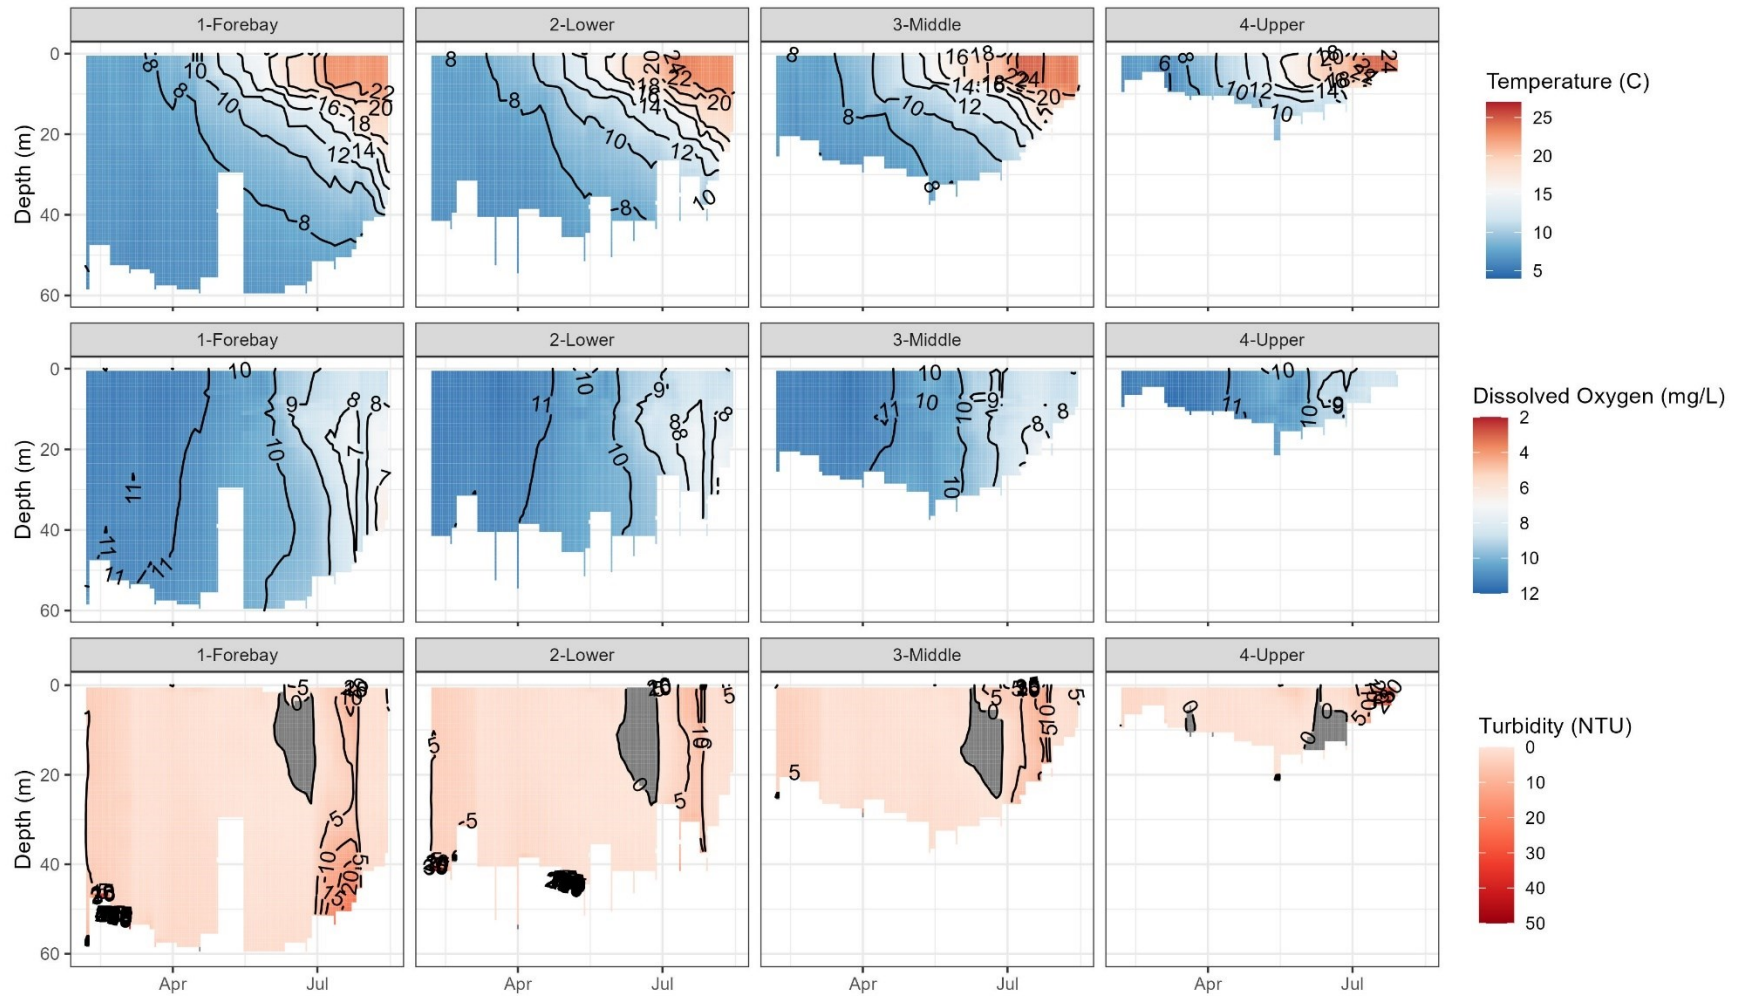

Figure 1. Lookout Point 2024 limnology data. Note that turbidity data in gray are suspect due to a sensor malfunction/calibration issue. Readings in gray were slightly negative (erroneous) but secchi measurements taken concurrently support that turbidity was near zero.

1 - Stated pickup timing is for bulk release groups. Fish will be picked up at least once per month year-round for screw trap efficiency trials.

2 - Total numbers includes all fish needed for RM&E purposes per Brood Year (i.e., annual basis) and will come from a combination of 'routine production' and 'additional production for RM&E'. Numbers have been rounded up for general planning purposes as 'extra' fish are needed to account for tagging and holding studies.
